1. HX-5B up and working great!

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-11-29 18:47:59 UTC
From: w4wb@arrl.net
Topic: 1 Message: 1

Welcome to the HEX-BEAM Group. I will start it off my presenting a short note on the HX-5B we recently installed at W4RT.

After sitting in the box for 15 months, we finally got the HX-5B HEX-BEAM (S/N 81) assembled and up in the air at our company club station W4RT (Tornado Amateur Radio Club) in Huntsville, AL. This antenna replaced the old Hustler 4-BTV we had mounted on the office roof for several years. To my knowledge, this is the first permanent installation of a HEX-BEAM in the Tennessee Valley. Although our experience with this antenna is limited, the initial impression is very favorable.

If you would like to learn more, then please see the file "HX-5B at W4RT Club Station" in the Installations Folder in the Files Area.

This Folder is a good place to locate files about your installation. Photos not embedded in the text in the file should be place in the Photos Area.

2. CQ Review of the Five-Band Hex-Beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-11-30 01:25:46 UTC
From: w4wb@arrl.net
Topic: 2 Message: 2

A nice review article of the HX-5B appeared on pages 30-33 of the April 2000 issue of CQ. It was written by Lew McCoy, W1ICP (now sadly a SK).

In Lew's concluding remarks, he stated "I was very impressed by the HEX beam. If I had to rate beams on a 1 to 10 scale, I would give this antenna a solid 10."

For members that own a HEX-BEAM, what have your experiences with it been? Any observations of performance vs height?

73 de Barry - W4WB

p.s. I have no financial interest in Traffie Technology.

3. Supergain antennas

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-11-30 01:36:29 UTC
From: w4wb@arrl.net
Topic: 3 Message: 3

One of the references cited by Mike Traffie is the paper by R. P. Haviland - W4MB. This paper, entitled "SUPERGAIN ANTENNAS, Possibilities and problems," was published in Communications Quarterly, Summer 1992. This is not an easy reference to find, so I make a pdf file of it and place it in the Files Area, Publications.

Please note that the paper comprises 18 pages and formed a large file, 3.3 MB.

73 de Barry - W4WB

4. Hex Beam vs. MA5B CushCraft Mini Beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-11-30 01:37:14 UTC
From: harry.edwards@sharkrack.com
Topic: 4 Message: 4

Well I believe that my land lord is going to allow me to put up a small beam at my office QTH! This is a dream come true as absolutely no beams are allowed in my snooty neighborhood.

I am trying to decide between the HEX-Beam and the CushCraft MA5B. Both get great reviews on e-Ham. I also e-mailed severl users of both and all are positive about their respective choices.

Thw CushCraft has a much lower price, and seems to have a better F/B ratio, while the HEX has specrtacular bandwidth with reasonable F/S ratios.

I am intrigued by the HEX and Mike T. has been very helpful with questions, etc.

ANY input on this would be help[ful. Since my company (I'm the CEO) is paying for this cost is not the object here.

Thanks in advance!

harry, W6DXO

5. K8AC's Installation of the HX-5B

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-11-30 02:51:42 UTC
From: w4wb@arrl.net
Topic: 5 Message: 5

We found the detailed installtion information provided by K8AC on

http://home.sprintmail.com/~sentek/hexpage1.htm

to be of value when we assembled the HX-5B. If you are going to be installing one, this is something to have printed out IMO.

73 de Barry - W4WB

6. Re: HX-5B up and working great!

I have a first, too. I used my 6 meter Hex-Bex while mobile through EM63, EM73, EM 74, and EM 64 during the ARRL September VHF contest. My rig was a Yaesu FT-817. The Hex-Beam was mounted on my vehicle. I got lots of stares from passing motorists. One person on I-59 rolled down his window and stuck his head out of the window to get a better look! 73, Ken AB4WL

7. Comparative Testing

I have been reading the Hex-Beam web site and considering purchasing the multi-band versions. This seems like a good place to read what other owners and experimenters have to say about the antenna.

10. How high is your HEX-BEAM?

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-01 21:30:52 UTC
From: w4wb@arrl.net
Topic: 10 Message: 10

The recommended height to mount the HX-5B is about 38-40 feet.

Anyone have experience using it at different heights, particularly higher (e.g., 50', 70', ...)? If so, please share it with everyone.

I have worked two HEX-BEAM owners on 20 m that had their beams lower on a temporary basis. One fellow in Canada had his on a 10-foot mast and was working Europe when I heard him receiving great reports. When I worked him, he turned the beam towards Alabama and his signal jumped up significantly. Even at this height, the F/B was over 2 S-units.

11. HexBeams - out of ham bands?

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-02 01:02:51 UTC
From: scoggin@cis.udel.edu
Topic: 11 Message: 11

I am an Army MARS/SHARES operator and find the HexBeam's light weight and low signature very attractive. Unfortunately, the frequencies which I utilize are quite a bit outside the amateur bands and are not harmonically related, to say the least.

Does anyone have any feel for how well a 30M or 40M HexBeam would run if utilized with an SGC-235 tuner? Frequencies of interest range from around 6.8 to 25 MHz...

Hi John,

Interesting question. I just ran an EZNEC model of the 20-m Hex-Beam I have to see how it responded way out of band. Understand that this model is not proven, but does give a reasonable idea of what is going on. I appeared that the SWR > 10 once the frequency exceeded about 15 MHz with the antenna tuned for 14 MHz.

You might ask Mike Traffie directly too. Number is 888.599.BEAM.

My HX-5Bi is at approximately 30' and performs well. My reference antenna is a tuned-feeder fed "hortical" (60' doublet with 30' vertical and 30' horizontal). The minimum improvement with Hex on its 5 bands is 2 "S" units on the other end. Many stations are Q5 on the Hex and inaudible on the hortical.

15. Easy installation of HX5-B on Aluma Tower

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-02 04:17:19 UTC
From: w2gff@earthlink.net
Topic: 15 Message: 15

I installed my HX5-B on a nested tower by myself, at night, and I'm 82 years old. It was really quite easy. Rope lines were run between two trees to suspend a pulley directly above the tower, which is attached to the house. A vertical line through the pulley was secured to the hub of the HX5-B, and the beam was then raised to the roof. Working on the roof alongside the nested tower, the beam was raised above the tower and the short mast in the hub was directed into the rotor. It took only about a half hour of work on the roof to put the HX5-B in place on the tower. The beam is so light and easy to handle it only required one hand to handle the support line while the other hand guided the mast into the rotor clamps. I will post some pictures of this installation.

Dick, W2GFF

16. My Hex Beam is not very high but it works very well

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-02 08:31:32 UTC
From: acbdzw@yahoo.com
Topic: 16 Message: 16

My call is K2ACB.In July of 2000 I purchased the HX5B Hex Beam.I had it installed professionally on my roof in September 2000.My Hex Beam is not very high.It is on a Glen Martin 4.5 foot roof tower.The antenna is on a 5 foot mast and I use a Yaesu G450-A rotator.

My antenna is only about 9 feet off the top of the roof of my 2 story house.It is about 36 feet from the ground to the antenna.I have an Icom 756 Pro transceiver and a Ten Tec Centurion amplifier. I usually operate barefoot or if I use my amplifier I do not run it more than 500 watts.Since the antenna is low and only about 30 feet through the roof from the second floor,if I run the amplifier to full power I overload the tv's ,telephones ,radios and speakers in the house.I do have them filtered but that doesn't help much when I run almost 1.5 kw. I do not have this problem of overload with my Gap Titan vertical which is about 60 feet from my house.

I consistently get about 2 to 4 S units better reports with the Hex Beam than I get with the vertical.I average about 12 db FB on the Hex Beam from reports I receive.My Hex Beam works out extremely well on the WARC bands and 10 meters and very good on 15 and 20 meters.

After speaking to Mike Traffie on the phone several times before and after I put up the antenna I finally had an opportunity to meet him personally at the Dayton Hamvention in May 2001.I must say that the support Mike gives to Hex Beam owners is excellent.

I could have put my Hex Beam up higher but I purposely put it on a low roof tower because I wanted the antenna to be as unobtrusive and with the lowest profile as possible.I work out fairly well with the antenna and have gotten some very good reports with it from all over the world.I have not made that many comparison tests with it.I did make some with friends who were running large tribanders such as a KLM KT34XA and 4 element monoband beams.One has to take into consideration a number of factors such as antenna height.location etc,etc when running comparison tests and my tests were not very scientific.My little Hex Beam could not compete with the large tribanders,quads or monobanders.Running the same power they averaged one to two S units better than my signal.I spoke to Mike Traffie about this and he attributed this to the height of my Hex Beam.He said that if it was higher and farther away from my roof I would work out better and be able to compete with the big arrays better.Perhaps he is right.But I am satisfied with my antenna the way it is now.

I have had from other qth's a Mosley Classic 33 beam which I had up for 12 years in midtown Manhattan in New York City.It was on the roof

of a 14 story apartment building.That was under my old call sign of WB2DZW and I also had a Cushcraft A3 beam which I had on top of a 4 story building in the West End of London England for 15 monthswhen I lived there.I would say that my Hex Beam is superior to those antennas and I also believe it is far superior to your average tribander.

What really sold me on the Hex Beam was the April 2000 article in CQ magazine on the antenna by the late Lew McCoy.It was one of the best reviews of any antenna I had ever read.I had met Lew McCoy at Dayton in previous years and I had a lot of respect for him as an antenna authority.

Prior to deciding about purchasing the Hex Beam I was contemplating purchasing the Force 12 C3 or C3SS antennas.I had heard people using them on the air and had heard only good things about them.At present I still have not made a comparable test comparing my Hex Beam to a C3 or C3SS antenna.However I wanted as low a profile antenna as I could find and the Hex Beam has more than met my expectations.

I know that there are some people out there who are skeptical about the antenna.One of them is L.B.Cebik,W4RNL who has modeled and written about antennas.I met him at the Dayton hamvention this year.He told me he felt the Hex beam was equivalent to a good 2 element beam but was not as good as the force 12 beam.However at that time he had not used or personally heard a Hex Beam though he had modeled the 5 bander.

I am far from an antenna expert.All I know is that as the saying goes the proof of the pudding is in its use.I have gotten very good reports with my Hex Beam.I have personally spoken thus far to five other hams in this country and abroad who have Hex Beams and all of them seem to be quite happy with their antennas.I have no interest in the company but I have recommended this antenna to a number of hams all over the world.I have also been the first contact with a Hex Beam for quite a few US and DX stations with the antenna.Some of them have never even heard of the antenna and I have directed them to the Traffie Technology web site or to the review of the antenna on eHam.net. Some stations I contacted I even sent copies of the construction manual so they could see how the antenna was put together. I wrote one of the first reviews of the antenna on eHam.net soon after my antenna was erected.I can be reached at K2ACB@...

if anyone has any further questions they would like me to answer on my Hex Beam.73-

Alan

Hi Barry,

Nice to have your response. What I wish to know is more field report from the current Hexbeam users in comparison with various beams. Further, any good reasons to pursuade my XYL?? hi hi.

I am currently considering to put HX-5Bi at the top of my roof tower on the top of my apartment building (30 meter high from the ground but only 3 meters from roof top). When I see the web from K8AC, it seems that I have to make through holes on my 50mm O.D. mast, which is unclear from his web as well as Hexbeam home page.

Anyway I look forward to any feedback in this group.

Thanks,
Shin, JR1NHD

I have just joined the group. My call is wo8usa. I am considering the follwing for purhase:
--Hexbeam HX5B
--Cushcraft MA5B
--Butternut HF5B
--HyGain TH2MH3
--TGM MQ-2

As I get data together I will post it. I am especially interested in overall size (so as to reduce needed infraststructure such as rotor), bands, gain, etc. Other opinions about these antennas will be greatly appreciated--I will by one. Wintertime antenna dreams are great, kind of like getting ready for fishing season I guess.

Looks like a great group! Thanks for forming it,

Chris wo8usa Dayton Ohio

Hi Shin,

I also hope that we get more comparisons. Alan gave one in his recent post, i.e., HB vs. Titan vertical. I also have a Titan vertical, but it is at the house while the HB is at the office (about 10 minutes away). I have listened to the 247 DX Net on several occasions at home and then gone to the office and listened. The difference is dramatic. I should point out that I think the Titan is by far the best vertical I have ever had.

What is the material comprising your roof top? If it is metal, you should be good to go. The only issue I know of having the HB at 30 m is that additional elevation lobes can form. Being near the roof should mitigate that to some degree I should think. Traffie has one of his HB mounted at almost 30 m and it works fine, but differently than the at 12 m.

Advise about persuading XYLs is beyond my abilities. hi hi
Seriously, tell her that you will paint it flat black so that it will not be easily seen. You can tell friends that it the latest high-tech outdoor clothes line. If that fails, I always try a new piece of jewelry. :-)

Hope that helps a little Shin.

25. Help!! I'm considering buying a Hexbeam or Force 12 C-3SS

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-03 01:55:34 UTC
From: tomac14@yahoo.com
Topic: 25 Message: 25

Hi:

I'm considering buying either a Hexbeam or a Force 12 C-3SS antenna. I've talked to several hams using the Hexbeam and they have had really strong signals and were extremely satisfied with their results. I've also talked to Mike Traffie who makes the Hexbeam.

Hexbeam seems to be the only antenna maker that talks about "RP" Reflected Performance and "SP" line of sight performance. Is this real or just a little marketing. I'd like some hard data about the Hexbeam forward gain.(Apparently f/b ratio is very good and is easier to measure than Fwd gain)

Has the antenna ever been tested on an antenna range or is most of the performance based on "testimonials?" The problem with testimonials is that the users really believe they are seeing an effect when,in fact, what they are seeing is the "placebo effect." If the antenna is as good as it is reported to be, then I would expect that the manufacturer would be anxious to back it up with hard numbers from a certified antenna range.

I'd like to hear from Hexbeam owners about why they chose the Hexbeam over other antennas (or from owners of competing antennas about why they didn't choose the Hexbeam.) I'd also like to hear about what tests, formal or informal, that Hexbeam owners have run on their hexbeam.

I'd like to make my decision before Dec 24, 2001 so Santa knows which one to pack in his sleigh.

I would really like to buy one, but I need more data on performance.

27. Hex-Beam: One Man's Bottom Line

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-03 04:13:24 UTC
From: rag@gng.co.uk
Topic: 27 Message: 27

I've owned my HX5-B since August. I only work 20-10 SSB, all 5 bands, primarily DX. My beam is mounted on my chimney with a Yaesu 450A rotor, the 20 mtr level is about 37 feet high and 7 feet above a slanting wood-shingled roof. There are rather full 60 foot high trees about 25 feet from the Beam, SW to NW. My QTH is on Long Island, NY, about 1/2 mile north of the Atlantic Ocean, 1 mile south of a large bay, elevation less than 10 feet above sea level. I run a Mark V and a Quadra amp at slightly above 1kw; a fabulous set-up which I love, but still 1/3 less power than the big boys.

I've never done any technical testing so this is "anecdotal", as they say. If I can hear the DX stronger than, say, S4, I work them within 3-5 minutes, usually first or second call, no matter how big the pile-up. Period. No exceptions. Honestly.

Indeed, when I first realized what was happening, I joked that the Hex-Beam has taken all the fun out of it. If I don't get someone after about two calls, I start checking my wires and gauges. I can't imagine using any other antenna, all I'd like to try is stacking the Hex-Beam.

I don't why we all feel obligated to say we don't have a financial interest in Traffie, but I don't either. But you couldn't ask for a more solicitous supplier or nicer guy than Mike.

As far as I'm concerned, there's no other antenna. I can't want to figure out how where to put a 40 meter one and get on that band as well.

If I sound infatuated, it's because I am.

Bob, K2SGO

Tom N0YD,

The problem with a range is that it will validate SP but not RP, to use the references you gave. I usually have one or more of my friends running the same power with various "other" antennas join in the same QSOs that I am in such as we did with N6RV today. I don't know how else you can validate actual long haul results.

Dick, W2GFF in Fairhope, AL, came up with a good idea. If you look at the photo of his tower and antenna (see Photos area), you will see a bright-yellow plastic arrow he made to help figure out which way the beam is pointing. This is particularly helpful under low-light conditions. If you are interested, I'm sure Dick will provide more details.

Hi Barry,

Where is such folder? I cannot find it.

Regarding the mast mount method, Mike Traffie was more than kind enough to offer me the hub undrilled so that I do not need to make a thru hole because mu antenna mast is very sold, not tubular type. Oh, I do not have any reason not to purchase Hexbeam expect the last but highest wall in front of me, it is my wife. hi

Hi Shin,

You have to "Sign In" on the web site of the group
http://groups.yahoo.com/group/hex-beam
and then click on Photos in the left panel on your screen. Then
double-click the folder SWR Plots. The click on images to enlarge.

FB on the mast. Seems the XYLs are the same the world over Shin! hi

I have a dozen clamp-on ferrite cores on the feedline just below the rotor. A few turns of coax on a PVC pipe form would have been better, but didn't think about it when I put the beam in the air.

I agree with your comment about it being a good home-brew candidate. However, the two or three home-brew attempts I'm aware of have been either one or two banders. Anyone contemplating a five band model using a single feedline should have lots of time to experiment, and a tilt-over or telescoping tower. I understand from talking to Mike Traffie that considerable experimentation went into the five band model. For example, the 20 meter elements are not resonant where one would think they would be, and they are different from the elements used on the 20 meter monobander.

If I had another tower and no neighborhood restrictions, I'd certainly have a home-brew 40 meter model in the air! I wonder if anyone has tried a home-brew 5 bander with separate feedlines. I'd guess you'd have to switch both sides of the coax feedline with relays to minimize interactions, and maybe that wouldn't be sufficient?

Hi Harry,

We used about 8 turns, 8" diameter as a choke. One was placed just below the rotor and a second one just as it goes through the wall panel to the shack. We don't seem to have interference with the alarm system or telephone system. Traffie advises that ferrite beads have been found to decrease performance. How much, I don't recall him saying.

Thanks for the replies regarding homebrewing hex-beams!!

I agree that making a 5 bander would be a time consuming process, and a bit tricky to get resonance on all bands. I tend to think that the mechanics of being able to easily prune and adjust the wire elements is the main hurdle to overcome!!

Anyway, I have 2 weeks holiday coming up, I've assembled most of the parts, and I have a fairly big incentive (an approximate $600US saving on the pre-made version).

I plan to take photos, and compile all the construction data once complete, so I'll post the info to anyone interested.

Regards all

Hello all,this is Paul,W0NMB and a very happy & satisfied owner of the two band HXL 1510 Hex beam. It's been up 18 months at only 26 feet and has been through 2 severe ice storms with no problems.

I've made no tests and all my comments just subjective but after 53 years I've been through my share of yagi's & quads.Believe me this antenna works wonders on long haul DX.I've logged hundreds of DX stations with my K2 at 5--10 watts and rarely is my report less than S7.Using my TS 850 seems almost overkill.This is mostly CW.

Anyway,26 feet works great for me on these bands

Hi Paul,

I thought it might me interesting to run a Hex-Beam model I have (generally ok, but still the fidelity needs to be improved) at the more typical 35'to 38' heights and compare with yout 26' height.

What I see is about what one should expect. At these lower heights, there is a single forward beam (true for yagis as well).

At 26', the -6 dB beamwidth in elevation is about 60 degs (15 to 75 degs) with the prime TOA at 34 degs.

At 35', the -6 dB beamwidth in elevation is about 44 degs (9 to 53 degs) with the prime TOA at 27 degs.

At 38', the -6 dB beamwidth in elevation is about 38 degs (8 to 46 degs) with the prime TOA at 25 degs.

Whether or not the values are exact is not the important point, it is the general trend that is my message.

What we can see is that the elevation beamwidth is a rather strong function of the antenna height --- changing the height by 11' changes the elevation beamwidth by from 60 to 38 degrees. In general, the very high elevation angles are not desired and waste energy. For some applications, this is just what you want however.

Also, the TOA decreases significantly --- 34 to 25 degrees.

Perhaps what is even more interesting is that the -6 dB TOA drops also a factor of two in this height change. Notice that the 3' change from 35' to 38' made little difference.

This is just FWIW. The antenna is a fine performer in any case and outstanding I think for a compact beam.

Topic: 25 Message: 53

I had your same problem. My analysis is that the hex-beam is better. However, due to the ~+$300 price difference between the hex-beam and the C3SS, I bought the C3SS. Of course, I don't have them both to compare, but in truth, I could not be happier with my C3SS.

See my web page, http://www.qsl.net/k4mg/ for pictures of the C3SS, and of my June and especially July log using the C3SS.

Hi Paul,

Well, shame on me. The numbers in the prior post were for 20 m since I think in terms of my 5-band antenna. I well know you have the 10 & 15 m version and you wrote it again. OK, I just ran it for 15 m (can do 10 m later if interested) and the results were interesting. The behavior is, of course, a function of frequency and height. So here are the 15 m results FWIW.

At 26', the -6 dB elevation beamwidth is 38 degs (8 to 46 degs) with a TOA of 24 degs.

At 35', the -6 dB elevation beamwidth is 27 degs (6 to 33 degs) with a TOA of 18 degs. At this point, a second beam is formed with its TOA at 66 degs and 4 dB down from the other beam. Its -6 dB (relative to its own peak) elevation beamwidth is 57 degs (47 to 102 degs, yep, going in the rearward direction).

I would guess that the 10 m beam at 26' will look at lot like the 15 m beam at 26' since the height and frequency ratios are almost the same.

C3SS, and of my June and especially July log using the C3SS.

Hi Barry,

Looks like you have been busy on PSK31. Since I have never used
the C3SS, I have three questions I would appreciate you answering.
First, how long did it take you to assemble the C3SS? Did you have to
spend any additional effort in tuning it (such as taking it down and
putting it back up)? Second, how does it work on 12 m and 17 m? I
understand that it requires a tuner, but have no idea how much
matching is required. Third, what rotor are you using? I should
expect that you must have something heavier than the $100 Channel
Master I used. Oh yes, isn't the price difference about $200 rather
than $300? I am using the price given by Texas Towers. You might
know a better source.

This is an intresting chapter from "Reflections II" by Walter Maxwell, W2DU, entitled "Some Aspects of the Balun Problem." The url for this chapter is

http://home.iag.net/~w2du/Reflections2Chapter21SomeAspectsoftheBalunProblem.pdf

and is provided by W2DU at no charge. Look at Section 2.6 in particular.

If you really want a good paper that explains baluns, this is a nice one. I am alos placing it in the Bookmarks section.

Hi Barry,
I put it together taking my time in one afternoon, using the middle position on all elements, and per my swr bridge it looked OK while down (hanging 7 feet in the air, off my tilt over tower. Worked with good swr across the bands. My ICOM 746 internal tuner will tune it on 12 and 17, also about 2.5 to 1 on 6 (I still don't believe this one). I got it before the last force12 price rise, so actually was comparing my old price with the current hexbeam price, so you are probably right about the $200 price difference. I have a Yaesu G-800dxa rotator. I still think the hexbeam has better specs, but as I said, I am satisfied. 73, Barry K4MG

Hi Chris,

I have a file for a 20-m Hex-Beam that (I believe) Roy - W7EL sent me last year. As I have mentioned before, it gives generally ok results but the fidelity of the model to the actual dimensions of the antenna is not so good. For example, the driven element and reflector are way too far apart. He has to use a matching circuit to get the proper impedance (too low without it) while the actual antenna achieves 50 ohm impedance without any matching network. As you bring the two element closer together, the impedance rises. In an actual Hex-Beam, the center parts of the elements are less than an inch apart.

I have attempted to model the 20-m beam myself using actual dimensions, but the results have been less than I desired due to limitations of NEC-2 (EZNEC 3.0 or Win-NEC) I have been told.

Beware the results from the model. I suggest they should be used for looking for general trends, not highly specific parameters such as gain or F/B.

Several folks have asked for source information about where ferrites can be obtained for RFI control and making the W2DU-type balun.

I have created a folder under Bookmarks entitled Baluns. The URLs for representative sources are listed there along with the chapter from W2DU's book Reflections II.

Typical materials are Type 43, 64, 73, 77, F, and J. Each material performs best as a RF attenuator over different portions of the spectrum. For typical HF work (80-6 m), Type 77 and Type F are preferred. For RG-213, Amidon makes a toroid FB-77-1024 that fits fine. You need at least 5 of them.

Palomar Engineers offers a balun kit Model BA-8 for $15 + $6 S/H. Antennex also sales the BA-8 for the same price.

Hi barry:

Your URL for the article was split into two lines (by the limited line length in the Yahoo Post message). Hence clicking on the URL will not work. After you click on the URL and get an error message, just add the following to the line in the URL window: oblem.pdf and then hit ENTER, and you get the excellent article in pdf format.

Thanks,

Tom, N0YD

Hi Tom,

Well there are baluns and baluns. Mike doesn't recommend the impedance matching balun; however, what we really are talking about is a RF choke to kill any RF that might be present on the exterior of the shield. It is my understanding from Mike that he does concur that the RF is a good idea. As mentioned in a prior post, the old 6-8 turns with 6-8" diameter near the antenna works reasonably well. WA6ROH gave us the url for the data developed by K1TTT for the air balun, which helps optimizes the coax coil dimensions. Mike has told me that one (or more) person tried ferrite beads and had problems. I have no idea how it was implemented. It is my intention, the next time I have the antenna down, to place the W2DU type balun (Type 77 ferrite sleeves) right below the antenna base. This appears to me to be an improvement over the K1TTT balun which is an improvement over the "old" coax coil RF choke.

As for how many use some form of RF choke (balun), I don't know. I do know some that do use one however (including me).

This may help too:
I've had some monster ground loop problems, in no small part caused
by RF creeping back up the shield, and have had good results using
line isolators from RadioWorks:
http://www.radioworks.com/clitop.html

Question:
I have vertical antennas now; I had thought they are more prone to
this problem than horizontal types. Not having experience with beams
or quads, as I consider purchasing a Hex-Beam I am concerned that
this seems to be such a big problem with this beam. Does anyone feel
the Hex-Beam experiences unusually bad problems with "RF creep"?

Hi Joe,

Thanks for the reference to RadioWorks. I have added it to the
Bookmarks for this site in a folder named RFI.

My experience has been that my verticals have always been more of a
RFI problem than my beams or dipoles. I run 1 KW within 15-20' of
our main telephone switching box in the office. No problems yet.
When we used the vertical, the linear could not be used without
knocking out the phones and the security system.

Well Joe, "RF creep" is certainly a new one on me! I'd advise all to stick with known physical and electrical phenomena - life is simpler that way. Feedline radiation is NOT a "big problem" with this beam. Many of the hexbeam installations I'm aware of are not unlike my own - the beam is mounted rather low to the ground and rather close to, or on top of, the house. With this type of installation, ANY radiation from the feedline can be a problem due to proximity to other electronic devices and wiring in the home. Likewise, direct radiation from the antenna can be a problem because of the proximity to home. I had my rotor cable, hexbeam coax, 2 meter beam coax all taped together and running down the tower. That resulted in a few problems, with interferance to electronic clocks, garage door openers, etc. In my case, simply routing the hexbeam coax down another tower leg and installing a dozen clip-on 1" long split ferrite cores around the feedline below the rotor reduced the problems considerably. I'd have wound the coax feedline into a choke at the same point if I had planned ahead and allowed enough extra coax.

If my hexbeam were mounted 50 feet from the house on a 70 foot tower as my tribander at the old QTH had been, there would be no such problems at all. Also, I've had no problems at all when running only 150 watts to the hexbeam - only at the 800 watt power level did problems appear.

Seems
> they are having problems with delivery of the fiberglass spreader
> rods, so a delay in sending it to me.

I ordered a 20-meter mono version a few weeks ago. When it got here I decided that if I was going to go through the effort to get it up in the air, I just as well spend the extra $$ and go whole-hog. Mike took the monobander back without question (it was never installed) and took my order for the 5-band unit. He told me they were backordered but expected to ship this week or next.

The hexbeam is more $$ than a standard (or mini) yagi but I looked at the total cost of the package. I figure that by the time I get this guy in the air, I'll have about USD975 into it, including the 33' mast, rotor, and cable. If I already had a tower and rotor in the air, the additional cost of the hexbeam would have been a negative factor. But after comparing the hexbeam's ice and wind loading to a conventional yagi (not to mention ease of assembly), it would have won anyway.

When I get it on the air, I'll post my first impressions.

Hi David,

Any relation to the David Douglas of Douglas fir fame? There is a
David Douglas High School in Portland, OR.

If you have information on parts and other items needed for your
antenna, it would be interesting to read it. I am also interested in
home brewing a multi-band version of this great antenna.

Hi,

I own an HF5B. It is a serviceable antenna and construction is fairly straight forward, though complicated in spots, but if I had it to due over, I would buy a Hex beam or cubicle quad. I'm one of those guys who feels that you not only pay for an antenna but also for customer service. I have not been real impressed with Butternut's somewhat moody customer service.

Hi Doug:

I like your idea for a hexbeam users(and wannabees) net. But how
about a time on Saturday mornings instead of Saturday evenings?

When enough people submit their preferences and we get a concensus,
time and frequencies will be posted. After this hopefully we will
have enough participation to provide value to all.

Monte,

I hope to be able to post something to the group after Xmas, after I have assembled the antenna. I'll also take some photo's to illustrate my plans!!

I'm currently having a few problems getting fibreglass spreaders, as there near impossible to buy over here. If fishing rod blanks are too expensive, I'll stick with long lengths of dowel, which I currently have supporting the elements of my Moxon Rectangle (been up 3 years without any breakage).

The centre section is the end piece from a drum of Belden Coax (as per EI7BA web-site), and a length of UPVC pipe. Wire will be very heavy duty speaker cable, with an arrangement at the end so that the element can be pruned without having to re-tension the whole antenna.

Anyway, best wishes with your effort and I hope to have something to show all by the new year.

Regards

David, VK2DPD

PS. I'd be interested to hear from anyone who now the layout of the feeder system for the "off the shelf" model. I have a few ideas for my homebrew effort, but would be interested to see the real thing.

87. "Nervous" questions

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-17 19:30:29 UTC
From: Herbert Meiselman
Topic: 87 Message: 87

Dear All:

Hopefully some simple and fast questions! I have ordered my HX-5Bi antenna and have been told that it shipped last week. Thus, I could start "playing" within the next week or two.

I plan to paint the white spreader rods to make the antenna less visible. Any suggestions on spray paints to use or to avoid? Any problem with some paints being conductive? Any parts not to paint? Paint prior to assembly (see below)?

Mike T. has agreed to a refund if I am not happy...but only if the antenna is NOT painted. Thus, I need to decide about painting either prior to or after assembly and roof mounting. The antenna will be mounted on a Glen Martin 4.5 foot tower on the roof of my 2-story house. The mast will probably be only one foot above the top of the tower (neighbors, wife, etc!). The flat-base "base" of the antenna will thus be about 28-30 feet above ground. Any potential problems? I'd just like to paint the six spreaders first, then start assembly...good/bad idea?

Sorry...turned out to be more questions than I thought!

Best wishes for the holiday season.

Regards,

Herb

Hi Herb
I too Plan to paint my Hex-Beam (5Bi) for the same reasons One report on e-Ham mentioned it without saying which type of paint was used.
I have actually had my antenna for several months and due to domestic circumstances have only just made a start on the painting, without asking myself all those questions Hi.
I am using a brush on TREMCLAD Rust Paint. dark green colour. The only paint I could find locally in a small tin (237mL)
At least using a brush one does not need to mask the anchor points etc.
Looking forward to any comments that come along.
Gordon

Hi Herb and Gordon,

I didn't paint my HX-5B yet but will the next time it is taken down, but have painted my Titan vertical. I used Rustolium Ultra-Flat Black (found it at Lowes). To hide it, you need to reduce reflections from the antenna. This paint works well and holds up to the weather. I still have to look hard to find the Titan since there are tall bushes and trees in the background. Neighbors and the XYL just don't see it anymore. :-)

Hi Herb and Gordon,

I didn't paint my HX-5B yet but will the next time it is taken down, but have painted my Titan vertical. I used Rustolium Ultra-Flat Black (found it at Lowes). To hide it, you need to reduce reflections from the antenna. This paint works well and holds up to the weather. I still have to look hard to find the Titan since there are tall bushes and trees in the background. Neighbors and the XYL just don't see it anymore. :-)

From: Floyd Sense
Topic: 87 Message: 91

My HX-5B has been up for 19 months now with no signs of paint failure. I used Krylon in a spray can - flat black. It's available at Lowes, ACE hardware, other home improvement stores. The antenna was completely assembled first, and mounted on a short piece of pipe a couple of feet off the ground. I first wiped the spreaders with alcohol and cleaned the spreader plate and bolts with Gunk prior to assembly. I applied a light coat of paint - just enough to hide the white. I decided not to use a brush because I didn't want a thick layer that might crack and peel later in our wide temperature variations. Painting the assembled antenna was a very fast and efficient process, since I could paint all sides of the spreaders without having to wait for one side to dry first. I did not paint the PVC center feed pipe - but would do so if I had it to do over again. I understand that PVC is prone to deterioration over time from sunlight and we have an over-abundance of that in NC.

If you run high power into the antenna at that proximity to the house, expect to see lots of interference to electronic devices in the home. My installation is similar, with the antenna mounted at the top of a 36 foot tower that's secured to the eaves of the house. I had to install a lot of chokes on AC lines to tame the worst of the interference. If I run only 150 watts, there's no problem at all, of course. This isn't unique to the hexbeam - you can expect the same problems from any antenna very close to the house.

Subject: [hex-beam] "Nervous" questions

Dear All:

Hopefully some simple and fast questions! I have ordered my HX-5Bi antenna and have been told that it shipped last week. Thus, I could start "playing" within the next week or two.

I plan to paint the white spreader rods to make the antenna less visible. Any suggestions on spray paints to use or to avoid? Any problem with some paints being conductive? Any parts not to paint? Paint prior to assembly (see below)?

Mike T. has agreed to a refund if I am not happy...but only if the antenna is NOT painted. Thus, I need to decide about painting either prior to or after assembly and roof mounting. The antenna will be mounted on a Glen Martin 4.5 foot tower on the roof of my 2-story house. The mast will probably be only one foot above the top of the tower (neighbors, wife, etc!). The flat-base "base" of the antenna will thus be about 28-30 feet above ground. Any potential problems? I'd just like to paint the six spreaders first, then start assembly...good/bad idea?

Sorry...turned out to be more questions than I thought!

Best wishes for the holiday season.

Regards,

Herb

92. IMPORTANT NOTICE - Price Change for Hex-Beams

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-19 05:28:38 UTC
From: w4wb
Topic: 92 Message: 92

Hi Folks,

I just looked at Traffie's Hex-Beam web site and noticed that an updated to the "T-TECH DESK" was made. Bottom line is that they are raising the price of Hex-Beams. You should read the entire letter/notice (see http://www.hexbeam.com/ttechdesk.shtml) to understand why this action is necessary.

In it they state that

"As a company, we have come to a cross-road. While concentrating on getting HEX-BEAMS "out there" we haven't realized that costs have crept up on us and that we have been selling antennas for less than they cost us! We now recognize something must be done if we are to continue forward."

and that

"As of January 1, 2002 the new price for the HX-5Bi will be $989.00 + S/H. Prices of other arrays will change accordingly. Present prices will remain in effect through December 31, 2001."

So if you have been thinking about buying a Hex-Beam, now is a good time to do so it would seem.

Best Holiday wishes to all and may 2002 be a great year for DX!

Well! Just bought the remainder of my hardware today for the homebrew Hex. Total cost will be in the region of $100-120 (Australian), about $60US.

If I can only get the thing to work I think I will of made the right choice.

Cabelas sells some very cheap fishing poles. I live in Portland, OR, near Woodland, WA, the fishing pole blank capital (Talon, Lamiglas, G. Loomis, and others I'm forgetting) and I haven't found anything cheaper yet.

Hi David,

Simple answer. Make knock-offs of EZ-HANGs. Just need to get some slingshots and 1 oz lead weights. Bet you can make your investment back then! Errr... are you folks down-under allowed to have slingshots now or have they been banned also?

Interesting solution Floyd. Just for fun, I looked at eBay to see if there was market on eBay for fishing reels in Australia. I was rather surprised that I found 12 offerings!

BTW David, what is your goal in achieving impendance matching for the several bands? Are you going to attempt a single feed like Traffie or separate/switched feeds? Any plans to use a matching network if you don't achieve the direct match?

From: Hal Williams
Topic: 100 Message: 100

There are a lot of used fiberglass Quads usually available if one asks around. Those spreaders are about 13 feet long, and it seems that a 6 band version could be made using them (30 thru 10 meters). Also, the quad uses 8 arms, so you would have two spares.
Hal, N6TZ

Attach them to six slingshots and give them to friends to put up temporary antennas.

102. Price increase: Is it worth it?

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-20 04:47:27 UTC
From: acbdzw
Topic: 102 Message: 102

I understand the rationale why Traffie Technology has to increase the price of the Hex Beam. However an increase of price by over $250 including shipping and handling will dissuade a lot of radio amateurs from purchasing this fine product. The increase in price will bring the antenna to over $1000. The average beam antenna costs much less than that and many radio amateurs who perhaps might have considered purchasing the antenna may now look for a cheaper alternative or try to build their own. I am not an antenna expert but I do wonder whether those who try to build this antenna, especially the 5 band model,will acheive the same results as the Traffie Technology model. Mike Traffie has spent a lot of time and money perfecting his design and whether others can do the same I do not know. I have asked Mike Traffie why he did not patent some of his innovations on the antenna. He indicated that what he did was in the public domain. I am not a patent attorney so he may be correct in that assumption. I do know that the radio amateur market is a small market. Many antenna manufacturers have had to rely on the commercial market to stay in business and their radio amteur business was just a sideline. To my knowledge Traffie Technology only produces antennas for the amateur market. Nevertheless I do remember companies like Telrex,Wilson,Swan and Tet that produced amateur and commercial antennas that are no longer in business. Other companies like Hy-Gain and Cushcraft were faltering and taken over by new owners. Some say that these companies have suffered under their new ownership and the quality of the product and especially customer service is not the same. I cannot say that about Traffie Technology and the Hex Beam. The quality of the product is second to none and the service is excellent. Mike Traffie has been in business for over 10 years now making Hex Beams. I think he has other businesses besides manufacturing the Hex Beam. I do hope that the price increase does not forebode that he will have to end production of the antenna in the future and his company will go the same way as Telrex and the others no longer in business.I wish him and his company many more years of success and innovation and should for whatever reason he no longer can manufacture the antenna I hope he will find a company that will continue to make his antenna according to his standards as was the case with the Alpha amplifier company.
Finally I must conclude by saying that i feel especially fortunate that I bought my Hex Beam over a year and a half ago when the price was only $599 plus shipping and handling. I really got a bargain on the antenna. Even at the new price I would continue to reccomend it but I can understand how many radio amateurs would balk at spending over $1000 for a ham antenna. Hi Alan,

Like you, I purchased my Hex-Beam almost 1-1/2 years ago at the $600 price. When I considered the selection of the antenna I would put up, I had some real limitations to consider --- the principal being antenna footprint. After looking at the various antennas that fell in the selection envelope, the Hex-Beam won out for three primary reasons. First was anticipated performance. I used input from Traffie somewhat, but really relied on several Hex-Beam users that are serious operators. They had nothing but positive comments. Second was overall system cost. Yes, the antenna costs more than the quads and aluminum Yagis, but you don't need an expensive rotor ($100 Channel Master works fine) nor an expensive tower. An inexpensive Radio Shack push-up mast works fine. When I added it up, the bottom line was about the same to definitely less. The third reason is environmental. I live in an area of frequent high winds and occasional ice. Having suffered damage to antennas from ice and wind in the past, this was most important to me. The design of the Hex-Beam has good wind resistance characteristics (low load factor and minimal torque). I think the proof of its ability was demonstrated with Chuck at the 3Y0C operations. It just can't get much worse than that!

We all will be watching with interest to see the process on the homemade 5-band Hex-Beams. From what I understand from Traffie, the geometry and dimensions are fussy if you want to obtain the performance of a factory Hex-Beam. Took them about a year to perfect the 5-band version I believe.

Hopefully, folks will continue to purchase the Hex-Beams and enjoy the remarkable operating experience that those of us using the Hex-Beam enjoy.

105. Real life comparison

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-20 06:00:23 UTC
From: Bill Archer
Topic: 105 Message: 105

I have been following the growth of this antenna since it was advertised at under $500 (not all that long ago) and have read many comparisons of the Hex-Beam to dipoles and verticals.

Has anyone had any real life comparisons of the Hex-Beam to yagis or quads?

It appears the Hex-Beam has a lot going for it but I have used a homebrewed 2 element quad on 10m and have had excellent results. Ok, I am a quad fan! When considering the purchase of a new beam I must compare the Hex-Beam to the LighntningBolt 5 band quad at under $300. The extra $450 bucks would make a big dent in the cost of a modest tower/rotor combo.

It seems every time I have the pennies saved up for the Hex-Beam the price takes a major jump and the evaluation process starts all over.

I would assume that the members of this reflector or either Hex-Beam aficionados or on the fence(like me) trying to make up their minds.

Please, lets hear some comparisons to other beam antennas.

Thanks for the bandwidth.

I agree with your comments Barry. But as you did point out price was one of your considerations. Looking back,if you had to pay over $1000 for the Hex Beam at the time you purchased it would you have bought it then? I must be honest and say that had I had to pay that much for the antenna at that time I may have bought a Force12 C3SS instead of the Hex Beam. I am glad I did not have to make that choice then because of the price.

> I agree with your comments Barry. But as you did point out price was one of your considerations. Looking back,if you had to pay over $1000 for the Hex Beam at the time you purchased it would you have bought it then? I must be honest and say that had I had to pay that much for the antenna at that time I may have bought a Force12 C3SS instead of the Hex Beam. I am glad I did not have to make that choice then because of the price.

Hi Alan,

Good question. At the time I got my Hex-Beam, there were fewer users and the "risk" was higher I guess. Several times more users are on the air now and I have yet to find a Hex-Beam owner that is unhappy. I'm confident that there might be one, or even a few, as that is just life. ;-)

From what I know now and having worked several other HB owners, I think my decision today would lean towards the Hex-Beam (but likely not 18 months ago had the price been almost $1000). By the time I now add up the total system cost (antenna, tower/mast, footing, rotor, cables, etc.) of erecting a C3SS or a Hex-Beam, the numbers are about the same. On the other hand, the time to assemble the Hex-Beam system is definitely less than the C3SS system. FWIW, I have talked to two hams (one an EA8) that have the C3SS and both plan to replace it with a Hex-Beam. I spent quite a bit of time with the EA8 running tests that he asked me to do. The C3SS seems to work well also from those I have heard on the air, but does it perform as well as the Hex-Beam?

Perhaps the price increase is justified... I just don't know. I had been saving to order one after the Holidays to put up in Spring but now at $1000 or so I think I'll re-evaluate my plans. While my available time is short I think I'll seriously look at building my own... or look at finally getting that Mosley in my shed in the air <grin>.

Costs may indeed have dictated the decision to raise prices... it's hard for smaller manufacturers to compete as it is. I think this is a tough decision for Hex Beam, I just hope it was well timed and thought out or we may be sans another fine product available commercially soon if sales drop dramtically. Hope not..... I'd still like one <grin>.

Dear All:

Just a couple of short comments:

1) Spoke to Mike T. this AM and I am convinced that he really does need to increase the price...lots of labor, including many hours to assemble and install the network inside the center mast. I guess the assembly is pre-made outside, then inserted into the plastic pipe...I wonder how they are able to make all of the necessary connections to the outside screw posts?

2) I tend to share the view that the antenna should be the best possible. I think it is like the current state of "hi fi" systems...the amps, CD changers, tuners, etc are fairly cheap and all of rather high quality, BUT the speakers are the weak link. One does need to spend to get good speakers, otherwise the whole system don't sound good. Maybe the same for transceivers and amps vs. antennas?

73 and all that,

Hi Brian,

Although every part of the signal chain is important, I must agree
with Bill that it all starts with a good antenna. The best receiver
hooked to a dummy load doesn't hear much while even a poor receiver
hears rather well with a good antenna. Frankly, it is hard to find a
really bad receiver today. Most have more than enough sensitivity
(most often well below the atmospheric noise level).

It just occurred to me that I spent far more for the complete set of
filters for my FT-1000MP than I did for the entire Hex-Beam setup I
have. Ummmm.....

Nice part of this hobby is that we can all invest where we desire! :-

119. Comaprison chart of "small" beams

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-20 23:47:20 UTC
From: chris_colliver
Topic: 119 Message: 119

I promised the group sometime ago to provide this information. Many of you may have it already. The following compares beams which I (being in the market to get a HF beam) believe are comparable from a size/performance standpoint; or at least they are the ones I am considering buying.

Please read chart as:
manufacturer/model/cost/bands/weight(lbs)/turning rad(ft)/wind load

Hexbeam/HX5Bi/750/10thru20/19.5/9.4/unknown
HyGain/TH2MK3/340/10-15-20/20/14.3/3.25
Cuschcraft/MA5B/269/10thru20/26.5/8.8/3.2(no gain 12&17)
Butternut/HF5B/595/10thru20/22/7/3
TGM Comm/MQ-2/369/6thru20/17/7/1.6
Force12/C3SS/579/10thru20/27/13.6/4.4
All antennas have decreasing gain with decreasing frequency.

The following are included for comparison
Cushcraft/A3S/429/10-15-20/27/15.5/4.3
Cushcraft/A3WS/349/12-17/22/14/4/4.1

The lightning bolt quads are not listed because I don't consider them to be in the same size/performance category.

It seems to be all in what your particular requirement is in priority order:
--space available for total system
--budget available
--gain required
--bands required
--pattern required (F/B, BW, etc)
--infrastructure needed for antenna

I have not made my mind up, but certainly will on Hexbeam in the next few days.

If anyone has other antennas they think I should add let me know.

From: Herbert Meiselman
Topic: 121 Message: 121

Just received the message from Chris, WO8USA regarding small antennas. I am about to receive my HX-5Bi (shipped last week) and will use it to replace a TGM MQ-2.

My experience with the MQ-2 has not been 100% positive: 1) very narrow SWR <2 range on many of the bands, especially on 20 meters; 2) "unstable" tuning such that both 20 and 17 meters changed (for no good reason I could see) after I had carefully adjusted them. Tuning requires adjusting the lengths of four tuning spokes per band, and to move up the frequency one cuts a bit off each spoke then re-attaches it to the antenna. Even when cutting 1/4 inch at a time, an unexplained change of the antenna requiring longer spokes poses a problem...they are now too short.

In brief, the MQ-2 is not for me! If only 1/2 of the positive comments about the HX-5Bi are true (or if each is only 50% correct), then I will still be much, much happier with my new HexBeam.

122. Homebrew Beam and prices

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-21 07:24:21 UTC
From: David Douglass
Topic: 122 Message: 122

Interesting to see the 2 camps...

Those that think $1000US isn't too expensive, and those that think it is.

To be honest, I fall firmly into the latter, but my main reason for wanting to try and home-brew one (apart from the fact my wife would kill me for spending $2000AUS+), is that, for me, half the thrill of working DX is doing it on equipment I have built. I don't have the knowledge or skill to build radios, linears and the likes, but antennas are a different matter, and with a little time and patience you can achieve pretty good results.

I've worked about 220 countries this year with my 100watts and homebrew Moxon Rectangle at only 10metres (including the recent P5 and YA DX).

As for feeding my Hex, I had planned to feed all elements with 1 cable, but haven't got around to working out how yet. I tend not to make any firm plans, as I usually change my mind several times during construction anyway. With regard to impedance matching, I've never really been one for requiring a low SWR and I'd be more keen to get a decent F/B ratio on all bands than having SWR under 2:1.

My next hurdle is the actual mechanical strength of the construction. I recently tried some thin (12.5mm) dowel as spreaders, but they were a little "whippy" and "too flexible. I'll try some thicker dowel next and if that fails will go to the expense of the fishing poles (thanks to all for the suggestions on the reels!!). For those who are wary about using wood for antenna supports, I have used it in all my beams and have a good friend who uses dowel spreaders in a 20M quad with no problems.

Anyway, I'll let you know how things pan out after Christmas, and best wishes for the festive season. After all, some things are more important than amateur radio (like drinking lots of Guinness and watching Football).

Regards

123. Looking for assembly/installation tips for hexbeam HX-5Bi

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-21 15:20:01 UTC
From: tomac14
Topic: 123 Message: 123

Hello;

I want to thank all the hexbeam owners who have provided info to me (via email and/or via QSOs on the ham bands) to help me decide whether or not to buy a hexbeam. An unmentioned advantage of the hexbeam is the wonderful community of hexbeam owners.

Finally, I decided in favor of the hexbeam, ordered it(a HX-5Bi) and it is now on its way to my QTH. It will arrive soon.

The purpose of this email is to request info, tips, tricks, etc on assembling it AND installing it. With all assembly projects, there is a Learning Curve. After you finish assembling something, you've learned tips on how you would do it differently if you had to assemble another one. Each time you assemble the same thing you learn more.

I'd like to receive tips on assembly AND installation from current hexbeam owners who have built one before.(Been there, Done that):

Use a coax choke or not?
Use a Radioworks line Isolators or not
Assemble two-piece arm before OR after installing in base plate?
Etc.

Thanks and 73,

Tom, N0YD "Yankee Doodle"

From: Norm
Topic: 124 Message: 124

Just a thought about all this talk of spreaders I was wondering if PVC pipe in the smaller diameters would work as spreaders. I don't know how it would hold up weatherwise or what schedule you would use. I have the HX5-B all assembled and sitting in a tripod in the backyard waiting for some help to get it up in the air. luckily I got it after the last price increase but I think I would do it all over again. As a matter of fact I would be interested in the 40 meter model. For those that have never seen one of them I suppose it would be hard to imagine just how labor intensive it is for Mike to put these antennas together. Also for somebody else who asked how the wires are attached to all those screws there is a special connector on the end of the wires that screws onto these screws. Just my 2 cents worth.

125. Performance Comparison of the HX-5B & a 3-Element Monoband Yagi on 17 m

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-22 15:42:08 UTC
From: w4wb
Topic: 125 Message: 125

Recently, at my request, Mike Traffie sent me a copy of his log sheets made during comparisons between a (5-band) HX-5B at 35' and a custom-designed, three-element monoband 17-m Yagi located at 42'. The comparisons were made in 1999. Both antennas were located at Traffie's QTH and on different towers.

The 3-element Yagi has, according to the computer model at 40', a TOA of 20 degs, azimuthal beamwidth of 64 degs, forward gain of 13.1 dBi, and a F/B of 24.5 dB. The boom length is 1/3 lambda.

The comparisons were straightforward. The receiving station was asked to judge which of two antennas produced the stronger signal. The HX-5B and the Yagi were designated as A and B; however, the A and the B were randomly assigned to the antennas to help keep the tests as meaningful as possible. Typically, the receiving station provided the RS estimate so that some quantitative assessment might be made. Mike recorded these RS values in his log. I should note that the signal reported ranged from 54 to 59+30.

Without knowing the calibration of each of the receivers, it is meaningless to use the data for any quantitative assessment. It is reasonable to accept that a S7 is weaker than a S8 on the same receiver however.

Combing through the log sheets was an interesting experience. Mike's contemporary notes of the QSOs were often helpful in interpreting a given set of data. QSB situations were noted and such data were excluded from my assessment.

In order to evaluate how well the 2-element HEX-BEAM compared to the 3-element Yagi (3-L), I culled the data to extract those QSOs that appeared to be solid. I then assigned the "winner of the QSO" to the HX-5B, the 3-L, or a draw (receiving station could not determine any difference). I located 54 qualifying QSO. (The power at each antenna was essentially the same.)

Since the two antennas are at about the same height, the performance comparison is generally reasonable; however, the 7' difference in height will slightly change the TOA of the Yagi (if the Yagi was a 35', its TOA would be about 2 degs more). I also note that one would expect that a 3-element beam optimized for 17 m would beat out a 2-element beam essentially all the time.

OK, now the results of my analysis. I note that most of the tests were done using SSB and a few using carriers (best way I submit).

When a station reported a signal was stronger/weaker, it was reported generally in S-units or in 5 dB increments once the signal exceeded S9. In other words, the difference was noticeable to the observer. Differences in TOA will result in where the footprint of the beam from each antenna hits the Earth and can account for some signal differences.

HX-5B 3-Element Yagi
Stronger 20 13
Even 21 21
Weaker 13 20
Total 54 54

Depending upon how you like to play with the numbers, the HX-5B was considered the stronger 37% of the time while the Yagi was stronger 24% of the time. They were reported the same about 39% of the time. Another view is to say that the HX-5B was equal to or stronger than the Yagi 76% of the time while the Yagi was equal to or stronger than the HX-5B 63% of the time.

IMO, this data can indicate no more than the two antennas perform with remarkable similarity. Put another way, the 5-band HX-5B performs, on 17 m at least, as well as a well-designed and constructed 3-element monoband Yagi!

For the FWIW department, I now list the prefixes of the stations comprising the data in the three categories.

HX-5B Stronger:
SM3, PP5, G3,G0,GM3,UT4, N9,W0, WO5, EA2, N8, VE7, UT7, 4N1, SM0, XE1, N7, N9, EI, ON

Both Antennas the Same:
AB7, WB0, EI, DL5, LA7, KB9, G4, GW0, SM7, JA, W4, W0, WA9, N9, G4, VO1, W7, YO, N6, VK1, W9

3-Element Yagi Stronger:
KS4, G4, NG7, EI, KI7, SP2, G3, ON, G0, KV7, PA2, W4, WB9

73 es good DX,
Barry - W4WB

From: chris_colliver
Topic: 121 Message: 126

Herbert,

Thanks for the comparison, it is very useful. I would appreciate any such comparisons, good or bad, be brought out for all to see. The new Yagi comparison by Traffie is also interesting.

I am concerned that we are getting too many Pro-Hexbeam views on the group. I may very well buy one, but it sure would be great to get some more side-by-side, real world comparisons from Hex owners of verticals, diploles, etc so some performance can be reported here. Surely all the hexbeam owners didn't through away their dipoles or mobiles!

I believe hexbeam wins the comparisons on from the weight, turning radius, and wind/weather effects perspective. But we need more critical reviews of operations for comparison sake. Many of us may have a decision to make in the next week!

Thanks to all for the continuing discussions....

127. A - B comparison of 15 meters

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-22 20:13:09 UTC
From: wb6roh
Topic: 127 Message: 127

Just had a nice QSO on 15 with Chris, WO8USA, in Ohio.
He had been reading the mail on a previous QSO I was having with Roy, K4HGX/C6A, on Aboco Island, NA-080. Roy and I had been running deltas between my HX-5Bi and my "hortical" doublet. On his end was a Icom 735 with a tri-bander. With a 100-watt carrier from me, he had the Hex at S7 and the "hortical" at S0. On SSB, he "heard" similiarly. He remembered the Hex from Chuck Brady's Bouvet operation.
Chris was running a vertical at 18' and had considerable QSB on the path. During the 35-minute contact, he reported the Hex the winner by 2 "S" units on SSB and when I went to full carrier. I wish him luck as he continues to weigh all the variables between products as plans his new antenna farm.

From: Floyd Sense
Topic: 125 Message: 128

Interesting. I've been using my HX-5B on all five bands for 19 months now. I've not had another beam up at the same time to compare it to, but it seems to me that the antenna is unusually "hot" on 17 meters. Front/back is the best of all the bands on 17, and the forward lobe appears to be a bit sharper there. Performance in pileups on 17 has been excellent.

Subject: [hex-beam] Performance Comparison of the HX-5B & a 3-Element Monoband Yagi on 17 m

Recently, at my request, Mike Traffie sent me a copy of his log sheets made during comparisons between a (5-band) HX-5B at 35' and a custom-designed, three-element monoband 17-m Yagi located at 42'. The comparisons were made in 1999. Both antennas were located at Traffie's QTH and on different towers.

The 3-element Yagi has, according to the computer model at 40', a TOA of 20 degs, azimuthal beamwidth of 64 degs, forward gain of 13.1 dBi, and a F/B of 24.5 dB. The boom length is 1/3 lambda.

The comparisons were straightforward. The receiving station was asked to judge which of two antennas produced the stronger signal. The HX-5B and the Yagi were designated as A and B; however, the A and the B were randomly assigned to the antennas to help keep the tests as meaningful as possible. Typically, the receiving station provided the RS estimate so that some quantitative assessment might be made. Mike recorded these RS values in his log. I should note that the signal reported ranged from 54 to 59+30.

Without knowing the calibration of each of the receivers, it is meaningless to use the data for any quantitative assessment. It is reasonable to accept that a S7 is weaker than a S8 on the same receiver however.

Combing through the log sheets was an interesting experience. Mike's contemporary notes of the QSOs were often helpful in interpreting a given set of data. QSB situations were noted and such data were excluded from my assessment.

In order to evaluate how well the 2-element HEX-BEAM compared to the 3-element Yagi (3-L), I culled the data to extract those QSOs that

appeared to be solid. I then assigned the "winner of the QSO" to the HX-5B, the 3-L, or a draw (receiving station could not determine any difference). I located 54 qualifying QSO. (The power at each antenna was essentially the same.)

Since the two antennas are at about the same height, the performance comparison is generally reasonable; however, the 7' difference in height will slightly change the TOA of the Yagi (if the Yagi was a 35', its TOA would be about 2 degs more). I also note that one would expect that a 3-element beam optimized for 17 m would beat out a 2-element beam essentially all the time.

OK, now the results of my analysis. I note that most of the tests were done using SSB and a few using carriers (best way I submit). When a station reported a signal was stronger/weaker, it was reported generally in S-units or in 5 dB increments once the signal exceeded S9. In other words, the difference was noticeable to the observer. Differences in TOA will result in where the footprint of the beam from each antenna hits the Earth and can account for some signal differences.

HX-5B 3-Element Yagi
Stronger 20 13
Even 21 21
Weaker 13 20
Total 54 54

Depending upon how you like to play with the numbers, the HX-5B was considered the stronger 37% of the time while the Yagi was stronger 24% of the time. They were reported the same about 39% of the time. Another view is to say that the HX-5B was equal to or stronger than the Yagi 76% of the time while the Yagi was equal to or stronger than the HX-5B 63% of the time.

IMO, this data can indicate no more than the two antennas perform with remarkable similarity. Put another way, the 5-band HX-5B performs, on 17 m at least, as well as a well-designed and constructed 3-element monoband Yagi!

For the FWIW department, I now list the prefixes of the stations comprising the data in the three categories.

HX-5B Stronger:
SM3, PP5, G3,G0,GM3,UT4, N9,W0, WO5, EA2, N8, VE7, UT7, 4N1, SM0, XE1, N7, N9, EI, ON

Both Antennas the Same:
AB7, WB0, EI, DL5, LA7, KB9, G4, GW0, SM7, JA, W4, W0, WA9, N9, G4, VO1, W7, YO, N6, VK1, W9

3-Element Yagi Stronger:
KS4, G4, NG7, EI, KI7, SP2, G3, ON, G0, KV7, PA2, W4, WB9

73 es good DX,
Barry - W4WB

Just to confirm Doug's comments-----

The Hexbeam was a consistent 2 S-units higher than the other antenna throughout the QSO. I appreciate Doug answering all the questions I posed and would encourage any prospective owner to set up a sked with him (he is more than willing to to this).

But let me tell all of the rest of my day----
--I posted the note requsting comparative reports on Hexbeam and others.
--I called Traffie to find out the shipping charges if I did indeed get a HX5B. I left a message, and did not expect an answer until after Christmas.
--After lunch i went out and found WB6ROH on the air--my first Hexbeam QSO and an answer to my previous post about comparative data.
--At 3:30 at Mike Traffie called me on his own nickle to tell me about the shipping charging (5%) but to also relate several stories and a lot of information. Would another company do this--on a Saturday before Xmas? I think we have all dealth with enough radio companies and others to know the answer. He could have easily blown this off until later but didn't. Mike also told me that, if I did decide to order one and did not like it, just send it back, full refund. I think the quality speaks for itself here.

I think I am confident that the price does indeed buy the highest quality antenna and service. Sure, its not a 6 element monobander, but I can't use one of those.

I will keep all posted..

Hi friends,

Hope you are spending a peaceful holy night with your loved ones.

Just today, Santa delivered a HX-5Bi to me. My wife envied me.
Thanks for all of your advices given to me till my purchase decision.
I wish to assemble this antenna as early as possible so that I will
come up as a one of Hex freaks someday soon.

Wishing you and your family a blessed Xmas.

Hello to all my hexbeam friends:

I received my hexbeam just in time for Christmas.
It arrived on Christmas Eve. Is Santa great or what???

I haven't opened it yet, but suspect it has a note like others that
I've seen this Christmas:
"Some assembly required and Batteries not included" !!!

I'm really looking forward to getting it assembled and operational.
By the way, I just worked my 105th country on my current vertical
antenna. Wait till I put the "hexbeam" on them!!!

Thanks to all the Hexbeam owners who provide me info that helped in
my selection of the hexbeam and their suggestions and tips for its
assembly. What a great community of Hexbeam owners.

And a Special THANKS to Barry, W4WB for all his help and support.

Tom, N0YD "Yankee Doodle"

Hi Barry:

Shin will probably beat me.

I'm going to put the arms together first inside my house. Then I may want to wait for the wx to get warmer so i can work on it outdoors. My tower is lying on my sundeck waiting for a base plate.

I'm really anxious to get it up and running but I want to take my time and do it right.

Thanks for your help and support.

If you have a garage, put it together in there and set it on a
ladder. I'll bet you a PL-259 that you will work at least 10
countries within 2 days with it setting on a ladder on your
sundeck / patio!

Mine was shipped last week. I guess I wasn't as good as Shin and Tom
this year since Santa didn't get it delieverd before Christmas! I
only hope that it's sitting in a UPS truck waiting to be delivered
tomorrow. I already have a temporary mast attached to the deck and
that baby's going in the air when it gets here, regardless of the wx!
(BTW, it's 3 degF right now :)

Hi friends,

It should be sunny (but chilly) tomorrow here so that I can assemble my beam. When I unpacked the box and checked the parts, I had one concern. Do I need to apply any coating on the elements? Manual does not mention about this point. This QTH is very close to Tokyo and the air is not as clean as in Rocky mountain. I appreciate your idea.

Hi Shin,

The only thing I would do is use something like COAX SEAL where the coax connects to the center mast of the HB, and also on each wire connector where they connect to the center mast of the HB. The wire itself should not suffer beyond getting an oxide coating on it over time. This should not degrade RF performance either unless your pollution is so bad that it eats up the wire.

Please take some photos of your installation process and post in the Photos sections. Your roof mount will be interesting to see.

GL on getting the HB installed on the 27th! Hope to hear you on the air soon.

Hi friends,

I successfully assembled and put up HX-5Bi today on the rooftop of my 6 storey condominium building. I briefly checked the SWR in all band and I observed that SWR is much better than that claimed by Mike Traffie or posted in this mailing list. It is 1.3 at the high end and 1.4 at the low end of 10 meter band. First QSO with this beam was WH6R on 17 meters. We enjoyed a chat for almost one hour by 57-57 all the time.

Thanks for encouragement to choose this antenna. I look foward to QSOing with you very soon. See the photo and you know how I put it up.

Good morning Shin,

Looks like you have a great installation! Being that high and in the clear is a big help in having a low SWR. Mine is at 30' AGL with odds and ends of metal 20' below it. The bottom line is that the antenna takes the power and radiates whatever you get into it. To me the SWR is more of a rig concern. When would you like to sked? 0000 to 0400 CUT is usually good for me into JA. Congratulations and be prepared to put the Hex on the world!

From: Leo Starrenburg PA5LS
Topic: 144 Message: 144

hello listusers,

i'm new to this list and don't own a Hex-Beam, but i'm very interrested.

As my HF antenna will be partly over my neighbours plot -with their kind consent- i wonder how your experience is with birds "parking " on the antenna. I'm not so much worried abt the birds causing a malfunction of sorts, but more abt what they'll deposit on the ground...

tia

73' Leo.

Leo,

If you are considering the 5-band Hex, it's turning radius is only 9.5'. Hopefully your mast / tower would be at least that far from the property line. My experience sees small birds with the proportionate amount of feces.

Hi Doug,

thanks for the quick answer !

A 9' feet radius would bring the rim just on the boundary so the droppings wouldn't be a problem !

Good morning Doug,

Thanks. Shame but small questions.....What does AGL mean? and CUT means Central Time in USA? I will be availabe to be on the air this weekend. Please let me know the freqs and the time at your convenience. 10 meters in the morning here should be good over the Pacific.

Sorry about my abbreviations. AGL is "above ground level" and CUT is "coordinated universal time" (same as what most call GMT). Your morning is my afternoon and evening as I am in California. You select a few frequencies and times. I will let you know if I can make them.

Birds have shown no interest whatsoever in my hexbeam. There are many trees around, so perhaps that's the reason.

hello listusers,

i'm new to this list and don't own a Hex-Beam, but i'm very interrested.

As my HF antenna will be partly over my neighbours plot -with their kind consent- i wonder how your experience is with birds "parking " on the antenna. I'm not so much worried abt the birds causing a malfunction of sorts, but more abt what they'll deposit on the ground...

tia

73' Leo.

Why don't we meet at 2300Z on 12/28 (0900 on 12/29 in JA) at
28.356MHz as you proposed. Unless I catch your signal, I will
call you at 15 minutes interval till 0000Z. Anyone is welcome
to join this schedule. How thrilling it is!!

Hi N5WDD,

What's your name pse?

I have a 6-m HB in the box. Got the HX-5B up, but haven't had time
to get the other one up yet.

See messages #6 and #73 for some more comments.

From: bbadger
Topic: 92 Message: 158

I do, actually, disagree. Usually receiver sensitivity is high -- making a hot preamp isn't rocket science. It's adjacent channel interference that makes the most difference in terms of QSO efficacy, and defeating that requires good headroom and good filters. Actually, a dummy load with a modern low-noise preamp works just fine as a receiving antenna... doesn't transmit that well, though. It's easy to make up for 60db of isolation on the rx preamp side.

Look at the differences in terms of gain between the best and the worst high band HF antennas (less than 20 db). Then look at the difference in terms of dynamic range between the best and worst receivers -> more than 40 db!

Antennas are important, but not as important as the receiver. I love QRP, and the difference at QRP levels is how good the rx stage is -- particularly on 20m when the kilowatt ragchewers hop on top. May God Bless and Keep the Alligators.... far from my operating frequency.

BTW: All of my bellyaching about the price increase just dissolved. I called Traffie and they will not be able to build or ship an HX-5B to me until March... at which time I will have the money to buy it. As a result, I ordered it at the $749 price!

So, come March, I'll be a Hex Beam Owner, and depending on the amount of snowfall we get, I may actually be able to put it up before June.

From: Makoto Tanaka
Topic: 159 Message: 159

I made a first-ever QSO with WB6ROH today. We could communicate on 10, 12, 15 and 17. Then I happen to talk with John W3UX on 12 meters using HX-5B.

When I checked the SWR again in five bands, it was 1.7 to 1.8 at the low end of 20 meter band. I believe that this element is a stadanrd one, not for SSB band. At the high end of the band it is very good almost 1.0. Do you see the similar situation?

Hi Shin,

I was on at 2300Z on 28.365 rather than 28.356 where you were. Traffie was on too. I had two QSOs with other JAs near you with them saying I had a booming signal (20 over 9). Glad you guys did get together. Will have to try again (being sure of the frequency, hi hi).

The reason your SWR is higher on the low end of 20 m is due to the fact that the SWR rises rapidly at the bottom of the 20 m band. My SWR riases to 1.6 at 14.000 from about 1.4 at 14.010.

So how do you like your HX-5B so far?

73 de Barry - W4WB

161. It arrived!

Yahoo group: hex-beam (2001 — 2006)
Date: 2001-12-29 03:16:07 UTC
From: Meiselman
Topic: 161 Message: 161

The good news is that UPS delivered it (the HX-5Bi) on the 27th and it arrived in perfect condition. I have already sprayed all the fiberglass rods with Rust-Olem light grey auto primer...it dries very, very flat and will be better against the sky than flat black (I hope).

Two brief questions (to Dr. Barry?):

1) Since I ordered the shorter SSB wires for 20 meters, I assume I will need to slightly adjust the positions of the attachment for the other 4 bands. At least the instruction sheet seems to suggest this will be necessary to take out any sag in the wires for the other 4 bands. To do this, I assume I move each clamp/holder just a small amount away from the central axis of the antenna...is this correct?

2) At the top of the center post, the instructions call for the coax to go up and over the top. I have a new 90 degree connector which I plan to attach to the center post with the female end pointing straight up. This will make the loop easier and less stressful on the coax. Any problem with this idea?

Final assembly/mounting/testing/enjoying will be delayed a bit due to family plans, rain, etc.

Best wishes to all for 2002.

Hi Herb,

I also ordered the 20 meter SSB elements for the HX-5Bi. Just set the assembled Hex on a ladder, drum or bucket. Starting with the 17 meter ferrules, loosen the clamps and ease them a small distance toward the 20 meter elements. Repeat this with the progressively higher bands until all lines have minimal droop. I heartily suggest that this and the whole assembly process goes much easier with 2 people, especially when trying to insert the tensioned elements into the insulators and tightening the set screws.

I would suggest that using a 90 degree adapter adds another mechanical connection and a little more loss. I had no problem coming straight out of the PL-259 and arching up to the top and coming down the side as instructed. I taped it heavily about every 6". Remember that the feedline does not "go over the top" and come down between the reflector halves. It comes down the "cold side" between a driven half and a reflector half. This is adjacent to the post that will meter a short between the SO-239's shell and the driven element's connection stud.

Good luck. Feel free to call me at 310-834-1695 if you need local support.

>
*****
Basically yes. Mike told me, and I found it true, that I could also rotate the clamps some as well to take out residual sag. Not only should the wires for a given band be coplanar to within maybe an inch, but the planes containing the several bands should be parallel. I found that I could stand back and eyeball it just fine, but then I have one of those characteristics that makes me go nuts if a picture is hung out of alignment! hi hi
*****

>
*****
It seems to me that the stress on the coax (turn radius) would be less doing it as instructed by Traffie than if you use a 90-deg connector. Be sure to use COAX SEAL or the like over the coax connection. Also, it is useful to have some cable wraps to dress the coax along the antenna mast and so on.

Hello:

Congratulations, Shin. You beat me. You had your antenna up yesterday.

Mine went up today, tonight actually, final work was in the dark. It's either on top of my tower or on my neighbor's flag pole. I'll have to wait for sunrise tomorrow to see exactly where it's installed.

I haven't had a chance to really check it out. But I just worked a station in the Canadian contest on 20 meters and his first words were "Ah, Big Signal." This is the first time anyone said that to me. I think this might be a good omen.

I'll give it a better checkout tomorrow.

Tom, N0YD

All,

After all my comparisons and conversations with many, I decided to buy the Hexbeam. I decided the size/performance ratio of the Hexbeam was the best on the market today. Further, I decided the higher cost was offset by the size/performance and the ease of construction/tuning.

Having said that, I sure hope Hexbeam does not let me down!

Hi Phil,

Doug has suggested this already, but it seems that it may just have to grow into a net. I am going to try to QSO with Shin JR1NHD at 2230Z today (29 Dec) on 28.356 or 28.365 (depending on QRM). Others at 2300Z. You and everyone else are welcome to join in.

Glad to hear your HB report. It is interesting that all I hear are such good reports. Your comment is the same for me, if I can hear them, I can work them.

Hope to hear you on-the air. BTW, what is your call sign?

I have a hexbeam and wanted to let folks know that it may be available for sale in February or March depending on my tower situation-I would prefer to sell it locally as in North Texas. It works great on top of my windsurf mast at 15 feet. I am in the Dallas Fort Worth metroplex and could possibly deliver in the area.

Regarding the 90 degree connectors: I opted to use TWO 90 degree adapters. The first is installed so that the female points "sideways" or horizontal. The second is connected to the first, with the female end pointing a few degrees from "down". This positions the female end on the side of the PVC pipe, where the coax is supposed to be routed. The result is a straight piece of coax with only a slight bend near the connector. Appropriate weatherproofing is required on the connectors of course. According to at least one research reference on the Web, the loss in the connectors is probably less than in a similar length of coax cable. As you'll see in the table at that site, losses in SO-239 and PL-259 connectors is extremely insignificant at the operating frequencies of the HX-5B. Note W8JI's comments on connector loss near the end of the page.

Subject: [hex-beam] Re: It arrived!

..snip..

I would suggest that using a 90 degree adapter adds another mechanical connection and a little more loss. I had no problem coming straight out of the PL-259 and arching up to the top and coming down the side as instructed. I taped it heavily about every 6". Remember that the feedline does not "go over the top" and come down between the reflector halves. It comes down the "cold side" between a driven half and a reflector half. This is adjacent to the post that will meter a short between the SO-239's shell and the driven element's connection stud.

Good luck. Feel free to call me at 310-834-1695 if you need local support.

From: Michael Melland
Topic: 173 Message: 173

Well guys I've had it..... I was mulling over the purchase of a Hex-beam and crying over the fact that the price was going up $300 on Tuesday. I had planned on getting one this summer.....

Must be the season.... it's really been bugging me. I have a rotor and control box, coax and a nice little used Mosley TA-33jr in my shed.... where it's been for about 4 years now. I just didn't know if it's what I "wanted" for a directional antenna so it sat. Then this Hex-beam "thing" happened. Heck.... I even actually coughed up coin for a call and chat with Mike Traffie earlier today. I've been researching, studying and listening to others rave about the antenna and wanted to speak to the "person" responsible. What a great guy.... nice chat ...he left me really "thinking"....

Then I went into my shack to install some new contesting logging software I got from Santa. I turned on my hot shot Racal 6790/GM receiver and listened to local AM stations for a while and thought I'd check out the bands..... must have been Karma.....

What did I hear on 10 meters !!!! Mike..... Shin in Japan.... etal.... all talking on Hex-beams !! That was the straw that broke the camels back !!

I just phoned Mike and ordered a 5 band Hex-beam !! Sure glad he was answering his phone at after 7 PM his time.... and I beat the price increase !!

Wooo ! Hooo! - finally a good directional antenna I (not to mention the xyl) I can live with and be happy with !!!

(I'm not excited at all..... of course <grin>)

Regards,

Mike, W9WIS

I received my HX-5Bi yesterday and spent most of today getting it onto it's temporary perch on my deck, at 15-ft. Waiting for the snow to melt off the roof before I put it where it really belongs.

I missed the sked by about 30-minutes, but will try to make it next week.

I've spent much of the evening being totally amazed at what's on my little FT-817... I've never even heard most of this on my old ATV-5!! I managed QSO's with Korea (569) and Japan (439) on 5-watts, more to come I'm sure.

I was very impressed with the Hex-Beam's quality and ease of assembly. It's almost impossible to put it together wrong. I can't add a lot go what's already been posted about this antenna, other than to say that it's all true. This is a great piece of gear.

73's,
Lynn, KU7Q

176. The HEX-BEAM NET?

Well maybe the HEX-BEAM NET is sort of starting up. Today, at least Doug WB6ROH, Shin JR1NHD, Barry W4WB, Phil K1ICO, Bill W4RK, and Mike N1HXA were on 28.356 MHz from about 2230 to 2315Z having a fine QSO. All were using a HEX-BEAM with the exception of W4RK who was using a vertical.

We are planning to try again next Saturday at 2230Z on 28.356 MHz. Please join in whether or not you have a HEX-BEAM.

In the FWIW department, I dropped by the 247 DX NET today and heard 3XY8A on. I listened for a while and noted that he was giving reports of 41 to 55 with most in the 51 to 53 range. I got on the list and gave him a 53 report. He gave me a 56 report with complements for the signal! OK, I was using the Quadra, but the HEX-BEAM was doing it job too. Sure is fun!

Hello:

As I reported earlier, I got my hexbeam up on 29 Dec. The only suggestion I have for the assembly instructions is that Step #1 should read as follows:

Step #1: Find a friend to help with the assembly.

It's not difficult, but there are times when 4 hands would help. I'm sure some people can do it alone, but an extra set of hands really helps especially when you are inserting the wire ends into the insulators. Otherwise, it is very easy to assemble. Absolutely no tuning required. In fact, there is nothing to tune even if you wanted to tune something. And the SWR was really great on all bands: 1.2 to 1.3 across 20 and 17 meters, 1.4 to 1.5 across all the other bands.

I've received excellent reports since I started operation. Yesterday I worked South Africa, Lithuania, Algeria, Cape Verde Island, Senegal, two in Japan, all with excellent reports. While I was working a station in Luxumbourg, Alan (K3ACB) broke in to say that he also had a hexbeam.

Today I heard Claude (KD6CYS) on so I gave him a call. Claude was the first person to recommend the hexbeam to me. He gave me a +30db report on 1000 watts and +20db on 100 watts. Another ham a couple of miles away broke in to say that I was +40db on 1000 watts and +30 db on 100 watt. Then Doug (WB6ROH) broke in to say I was +20 db in Carson City CA.

So in just this short time, I've worked 3 other hexbeam owners. I'm working on on my HXCC Award, which requires that a hexbeam owner work 100 other hexbeam owners!!! We could also have a WAH Award, which requires a hexbeam owner to work all other hexbeam owners.

Who will be the first one to get the HXCC Award?

73 and Good Luck on your HXCC Award,

Tom, N0YD "Yankee Doodle"

Congrats, Tom. I look forward to QSO with you next weekend.

I really agree that we need at least 4 hands to fix the arms which is the most time consuming job. Once I fixed the six arms on to the center plate, it took us only 30 minutes to finish the job. I need to work another 95 hex owners to get HXCC hi.

Wishing you and yours a happy new year and happy Hexing.

Congratulations Tom!

I also agree that one should really have a friend help. Assembly in 90 minutes is reasonable the first time and less than one hour thereafter.

Hope to hear you on next Saturday or maybe even before. Alan K2ACB heard me on 15-m this afternoon and gave a call using his Hex-Beam. We had a nice QSO. Alan also has a GAP Titan vertical that he switched between. With him running 100 W, the vertical was a solid S-7-1/2 and the Hex-Beam was flickering between S-9 & S-9+5 on my FT-1000MP. Since I also have a Titan vertical, it was most interesting to hear a direct comparison.

My HXCC count is 9, but how do we "keep score?" How about homebrew Hex-Beams counting or not? Maybe HXCC could a topic for the next HEX-NET.

73,
Barry - W4WB

Hi Barry:

Looks like my HXCC idea is starting to catch on!!!

So far, you are on the top of the leader board with 9, Shin has 5, I
have 3 and Lynn has 1.

I hope to be on next Sat for the sked with Shin.

Yes, maybe HXCC could be a topic for the next HEX-NET.

Thanks for all the help that you and other "Hexers" have provided.

Hi Herb,

Glad that you got your HB in and nearing installation. Guess I could tell you that I just worked A31MO on 20 m and got him on the first call in the pileup. But then I would also have to say that he said "strong signal and a 59." Reports he was giving for others were not so good. :-) Hope your experiences are as much fun with your Hex-Beam and that you can join in on Saturday!

Happy New Year,
Barry - W4WB

Eric G0CGL.

Hi Herb,

Glad that you got your HB in and nearing installation. Guess I could tell you that I just worked A31MO on 20 m and got him on the first call in the pileup. But then I would also have to say that he said "strong signal and a 59." Reports he was giving for others were not so good. :-) Hope your experiences are as much fun with your Hex-Beam and that you can join in on Saturday!

Happy New Year,
Barry - W4WB

OK, Barry. I guess we better stop picking on "poor 'ole Herb." I
guess
if he isn't on by next Saturday I'll have to round up my club's
antenna crew and show up on his doorstep. How about swapping some "4"
DX for "6" DX?

Come on Herb, where's the ol' ham spirit.. I'll trade rain for snow almost any day! My HX-5B is sitting contently on a 10' temporary pole attached to my deck (see the photo I posted in the photo area). Not ideal, but it works. One plus is that the XYL will be VERY happy to see it moved to it's permanent location when the snow melts (more than a little reverse psychology going on here :)

Good luck, hopefully when it stops raining in CA it will stop snowing in UT.

Gentlemen (?):

You guys really know how to hurt a guy...especially when he is down and out (or at least his antenna is down and not connected)!

As the proud owner of #188, I will try to get it onto the roof this weekend. However, if WB6ROH wants to help, I can offer an adult beverage or two as a reward.

Thanks again for your kind understanding and sympathy...with friends like you, who needs....

From: David Douglass
Topic: 197 Message: 197

Hi Guys,

Well I'm just about there! I put the elements on today and only need to figure out the phasing/feed system tomorrow and give it all a last coat of paint and get it up on the roof for tuning. (if anyone knows what's inside the centre post, please let me know)

I would suggest that anyone else planning to put one together should spend a little time planning things out as I've come a cropper a few times so far. The strength of spreaders and thickness/type of wire are pretty important to get the whole thing looking OK. I tend to think the wire I've used is a little thin, but time will tell and this is only a prototype. Once fully assembled I'll post some photo's/info for anyone interested, but will say that this is not a project for the faint hearted.

198. Rotor on the Hex

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-02 13:22:39 UTC
From: John Caulfield
Topic: 198 Message: 198

Although the smaller rotors will easily turn the hex beam, you might want a rotor that has a brake on it. The wind will move the beam back and forth and eventually take a toll on the gears. Something I did not think about in construction phase. I used the Yasue G450.

You can take a look at the installation on QRZ.com.

Happy New Year!

I don't think that this is a problem as it is with yagi's and quads. Since=
the Hex is basically symmetrical, winds gusting from different directions s=
hould exert little rotating torque on the antenna. This is clearly not the =
case with yagis and quads as they would present different wind loads dependi=
ng upon which way the wind was blowing. At any rate, some of the Channel Ma=
ster rotors have beefed up gears to handle CB and smaller amateur beams. I =
just received a new flyer from AES today and see that they have a new Channe=
l Master (think it was the 9521?) which appears to be similar to the 9515 I'=
m using, but at a lower price and it has an infrared remote control as well.=

Yes, this is the rotor I bought for my beam... it's a very nice unit, not as rugged as the higher priced ham units, but I only paid $65 for it from http://www.consumer-direct.com... it's kind of like buying a Hoover instead of a Kirby vaccum, you can buy a lot of these for the price of one of those.

The control box is very small, ~6"w x 1"h x 3"d and displays the azimuth directly. The unit can be set to recalibrate itself every 10 operations. To do this, it overruns itself to the 0 degrees position then returns to the original setting. You can also force a recal manually. It also runs on a wall-wart (18vac @ 1 amp) and uses 3-wire rotor cable from Radio Shack.

To use the IR control, you just press the azimuth you want and the beam spins. You can also pre-program 69 individual settings. It's nice to put the control unit up on the shelf and not have to reach for it everytime you want to move the beam. In addition, the manual says most universal remotes will support the unit.

All in all, I'd give the unit 5 out of 5.

Hi All,

Have the beam painted and up on the roof but only at about 15foot so far.

The part I mentioned yesterday about selection the element wire turned out to be true and I snapped an element when hoisting it on the roof.

I still have a fair bit on tuning to do, and think I would feed each element individually if I was to make another one. Another possibility would be the use of linear traps for the suppression of currents induced from the neighbouring dipoles elements in the beam

I don't think I'll be able to tune all 5 bands with the current feed method, but am hoping for 3 or 4. At the moment I'm listening to the UK on 20metres and have about 3 S units difference from the front to back of the beam, so that is promising, but too early to tell. I've also just had a 569 report from Italy with 50watts, so it is radiating, although I'm sure that everyone knows how inaccurate this type of comparison is!!!

Anyway, I'll keep everyone posted of the progress.

204. Extra clamps on the arms?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-04 00:13:46 UTC
From: Herbert Meiselman
Topic: 204 Message: 204

Hello again!

Yes, I will put # 188 up this week end, so don't worry.

BUT, I do have a small question: looking at the pictures posted by K8AC, I note an "extra" hose clamp near the beginning of the outer arm section. That is, it clamps over the outer section of the overlap between the inner and outer arm. But no mention of these extra 6 clamps are provided in the instructions, nor did any come with the antenna.

Is this a recent change or a prior design which is no longer valid?

Many thanks,

Herb K6HJM

Hi Herb;

Those clamps you see in the photos don't exist on the new version, HX-5bi. I talked to Mike Traffie and he said he had made some improvements to the way the arms are made and this eliminated the need for those clamps. I've got Hx-5Bi S/N 189 and they aren't on mine either.

207. Homebrew Hex part 3

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-04 08:00:20 UTC
From: David Douglass
Topic: 207 Message: 207

Hi All,

Well, had another go at tuning and have hoisted the antenna up to about 35feet.

I have 3 bands tuned in well, but have managed to get 17M resonance about 150KHz above the top of the band, and can't get a better SWR on 15M than about 3:1 (Not that SWR means a great deal from a performance point of view). Raising the antenna seems to improve things a lot, which is worth bearing in mind, when your making one.

From my initial tests (on 20Mm only so far due to propagation), I'm a little disappointed with the F/B ratio. I haven't done a great deal of experimentation as yet, but will hang my hat on the line and say that it's not in the same league as the old Moxon Rectangle. This is maybe a little unfair as the Moxon is renowned for great F/B ratio, and I did used to feed all elements separately on that beam, but there my initial thoughts anyway.

On the plus side, the visual impact of the Hex is much better, and it's so much easier to turn than the old Moxon. I can vouch for this, as my mast drops through the shack roof and is turned by hand (why pay silly money for a rotator, my 'Armstrong Method' gets the job done quicker and gives me a work out at the same time). As well as this the wind loading looks good also.

I wonder if anyone has some "real" figures on F/B ratio on the Traffie Hex. I'm sure everyone is aware that the F\B ratio bandwidth on the Hex is very small, I just wonder if anyone has bothered measuring it???

Anyway guy's, I'll have a listen out over the weekend and see how it performs. I may even have a wonder up to the un-civilised part of 10M to try and catch your net!!

Hi Barry,

Thanks for the e-mail and encouragement!!

Unfortunately conditions are really poor this evening so not much chance to give it a try out, but from what I can see I am getting some F/B ratio on all bands, which is good considering the small amount of time I have been tuning. Conditions to this part of the World have been pretty poor for the last week or so, so have not been able to give it such a good try out, but it seems to be OK for a first effort.

Unfortunately, I will be out tomorrow so will miss the net, but a good idea for giving the antennas a try out.

I wonder if you have had a look at the following site..

http://www.cebik.com/4.html

It gives a good theoretical comparison between the Hex and some similar antennas. Whilst I appreciate these models are never totally accurate, It does explain what I mean by the Hex having a "narrow bandwidth" with respect to F/B ratio.

I suppose ultimately, it all comes down to what people are after. generally the first thing I look for in a beam is F/B ratio, as I usually run pretty low power (CW and a little RTTY), and tend to work weaker more marginal stations. Obviously good F/B ratio is more critical for eliminating QRM. I think a lot of people get hung up on VSWR measurements, and at the end of the day a good SWR reading tells you very little (that's my story and I'm sticking to it!!). To a lesser extent. I think antenna gain is also a much over used phrase, and whilst everyone would like to think they have a "super-gain" array in the Hex-beam, I would challenge anyone to explain to me what one of these is - as I don't have a clue.

Anyway, enough bitching!! I do think that the Hex is a definite contender for "THE BEST COMMERCIAL SMALL BEAM ON THE MARKET", when you consider size, windloading, and design into the equation. I think I will take some convincing that it is better than the C3SS, especially when you factor price in!!!! As to whether the hex will perform as well as properly adjusted 3 element Yagi (as has been suggested) - "well this is time of year we are expected to believe in Santa Claus".

I must admit, when I look at antenna prices, I think about how much it would cost me to make the same thing - and with the Hex, I would say about $150-200US. I do however, now, appreciate some of the initial work that must of went into the design of the antenna, and if this was is to be factored into the price along with construction costs - well maybe $1000 is cheap??

Anyway, thanks again for the mail Barry and CUL

David, VK2DPD

209. What tower are you using ?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-05 18:40:35 UTC
From: Michael Melland
Topic: 209 Message: 209

Now that my Hex-Beam is on order I need to plan what type tower to put it on. What are you guys using ? I know squat about towers. I "think" crank up is the way for me to go.... over 6 ft off the ground I freeze up <grin>... so if I need to perform any maint. on it I'd like it to be low to the roofline. Planning to mount next to the house and bracket the tower for support onto the house ??? I'd even consider a roof tower although I suspect objections from the xyl on that.... a 150 year old house just might not look right with a tower on the roof <grin>.

Any thoughts ? Advice ? How are those of you using the Hex push up tower mounting/rotating ? I have a Hy-Gain CD-45II for a rotor.

I "think" crank
> up is the way for me to go.... over 6 ft off the ground I freeze up
> <grin>...

Mike,

One of the reasons I chose the Hex-Beam was because it didn't need a
tower.

For my installation (not yet completed BTW), I'm planning on using
three lengths of 10' x 1-1/4" rigid conduit attached to the side of
my two-story house. I chose a location where I have a mid-level pop-
out so I have two attachment points to the house, one at 11' and one
at 22'. I'm using Uni-stut brackets & conduit clamps lagged into the
facia to make the attachment to the house. For the foundation, I
bought a pre-formed cement 4x4 post base (the one with the u-shaped
post bracket on it), like you would use for anchoring a deck. I
buried it in the ground so just the mounting bracket is exposed.
Then I drilled a 1/2" hole in the bottom conduit and put a 1/2" bolt
through the u-bracket and the conduit, creating a hinged-base.

My "plan" is to assemble the entire mast, rotor, and antenna on the
ground (mast tilted up so the antenna clears the ground), then attach
a pulley at the top bracket on house and use a rope pull the whole
thing up vertical. I'll then have to get on the roof long enough to
attach two stablizing struts to the last 8' of mast above the roof.

I plan on taking pictures of the process and will post them in the
Photo section. So far, I have about $200 into the mast, rotor, rotor
cable and coax, not too bad for a 5-band beam!

Hope this helps,
Lynn, KU7Q

I have mine on an old Triex 37TC (37' - 2 section light weight) crank up. It is at about 30' AGL due to city mandates. The rotator is an old AR22 with repeatability problems. The Hex seems to work well for me at this low elevation. If I could I woild probably run with the antenna at approximately 38' AGL. Due to the weight of your proposed rotator I would be cautious of using any of the cheaper garden variety push ups. You might call Mike at Traffie for additional info on his 30' mast. Good luck and welcome.

Hi Mike,

Dick W2GFF lives in Fairhope, AL and is 82 years old. His installation can be seen in the Photos section and the description in Message #15. I have been to his QTH and can tell you that this is a first-class way to go. Dick is always happy to share his knowledge.

214. Up and running!

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-06 00:31:39 UTC
From: Meiselman
Topic: 214 Message: 214

Hello to all:

OK...after a bit of waiting for weather, help from KR6CV, etc., # 188 is up on the roof of my two story house. It is mounted on a 4.5 foot G-M tower with about 6-8 inches of mast above the top of the tower. Thus, I guess its base is about 25 feet above ground level. Lots of coax seal on the top connector plus on each of the elements attached to the center post. Even 7 turns of coax on a 4.5" diameter plastic core...a slip coupling...female-female...for 4.5 inch plastic pipe.

IT SEEMS TO WORK VERY WELL! First contact was Quebec City, Canada, who said I was 59+ and the strongest signal he had ever received from the Los Angeles area. Either Mike T. has paid "shills" all over the USA and Canada, or else I got me a great antenna.

Look forward to being part of a sched and even trying for the rare and coveted "HXCC" award.

Congratulations Herb and well done! Hope to work you soon and get
another HB point for HXCC.

Listen out for 9U5D. He was on 12 m earlier. He was running the
pile split down and by the numbers. When he started taking 4's, it
was a mess. I waited for a few seconds and gave my call sign twice.
Happily, I was the first station to which he replied, with a 59
also! He was giving real reports. Next 3 were 57's. Think Mike had
him listening out for me? hi hi

Let us hear about you contacts too Herb. Have fun!

Hi to all:

I just added two photos of my hexbeam intallation to the Photo section of the Hexbeam Users Group.

Photo #1 shows the Hexbeam on a tower sitting on my sundeck.

Photo #2 shows the bottom part of my 30 ft Rohn 25 tower sitting on a steel plate on my sundeck and strapped to the chimney.

I'm up to 7 on the HXCC Award and Barry W4WB is up to 10, I think.

Good DX to all Hexbeamers,

Tom, N0YD "Yankee Doodle"

222. Progress report

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-07 03:27:31 UTC
From: Meiselman
Topic: 222 Message: 222

Hello to all:

For those of you who do not live in Southern California...today it was 75 F, blue skies, and a fantastic sunset!

I am now sure that Mike T. has paid hams in several countries to give very positive reports to anyone with a Hex Beam. Today easily worked YV5LAX who said I was 56+20 (really!). Also GI0TIC at a 57...the UK and Ireland are difficult from my QTH due to big dirt filters (aka San Gabriel Mountains) to the north of my house. Most amazing were contacts with LU1ECZ and LU3CQ...both said I was 59 or 59+ and I was only running 80 watts (the Ameritron amp was turned off and 80 is what I usually drive it at). So far, I am a very happy camper!

When someone has time, could they please send me the schedule for the HXCC group...freq and day and UTC ??

Many thanks,

73,

Glad they came back. Yahoo! was having problems today, so who knows.

FB on QSL. Regarding HXCC credits, I would think that the DXCC rules apply in that a Hex-Beam worked anytime counts and from anywhere in your base entity. Comments?

Just saw your homebrew Hex photos. Nice job! From the detail I can make out, it appears the the tip to tip spacing between DE ends and REFL ends is quite wide. You may want to tighten these up a lot; remember the concern here of high voltage points though. If you look at the basic formulas that are in the article that Mike Traffie published in Communications Quarterly and Barry put on this site, you will see what I mean. Continued good luck!

229. Homebrew Hex Pictures

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-08 06:55:34 UTC
From: David Douglass
Topic: 229 Message: 229

Hi All,

Have just loaded a few pictures of the completed 5 band homebrew Hex to the pictures page a Yahoogroups.

These are all of the completed installation, and were taken last night on a digital camera. I have some close up pic's, but these will have to wait to I get a film developed and scanned in.

Basically the hex is made of 6x 3metre lengths of 16.5mm Tasmanian Oak dowel. These have been extended by a further 12 inches or so, with thinner doweling that is inserted into holes drilled in the ends of the thicker wood. This join is re-enforced with a hose clamp. The centre plate is the end of a drum from a roll of coax (thanks EI7BA for the idea), and the centre pose a length of PVC pipe.

All the wood is treated with 2 coats of decking oil and given a spray of silver car body paint (all I had a hand). The connection points on the centre post are brass bolts that are inserted into drilled holes in the post. This is tricky operation, but quite manageable. I have used a length of 300ohm ladder line to join these up to form the single feed system (again all I have available).

The elements themselves are made from a roll of speaker cable I had available, and are considerably thinner than 14SWG, but again I had it in the shack and this is fine in this prototype.

The element ends are soldered to brass washers, that inturn are screwed onto the brass bolts of the centre post.

To allow adjustment of the element length, I initially cut the dipole elements and reflectors to the same length (approx 450inches for 20M). I then cut off about 3 feet from both ends and soldered a brass washer/ring in place and then soldered the 3 foot of wire back on. I then tied a 3 foot length of string to the washer to hold the element in place, leaving me with 3 foot of wire to prune from both ends.

The centre post has an end cap, with a SO239 connector in place (a lid from a can of fly spray).

I initially held all the elements in place with nylon rope connected to the centre post. Once the elements are connected, the rope can be removed. The wire connects to the spreaders by means of plastic tie wraps or similar. Once everything is in-place the pruning can begin.

"Sound Simple"??, well it actually is. probably the best thing about the geometry of the hex is that the design is basically simple. In fact so

simple it's brilliant. Most of the construction techniques used were a bit 'dodge to say the least but I only plan on having the thing up a month or so to evaluate the performance.

I initially tuned the antenna about 5 foot off the ground, and then finished on the roof at about 15 foot. SWR is V.Good on 20M, 12M and 10M, resonance is at 18.300 on 17M and I can only get the SWR on 15M to about 3:1. I think this may have as much to do with my feed system than the antenna itself.

F/B ratio is roughly about 3 S-points on all bands, although 15M seems to be not as good as the other bands. As for the gain, I haven't got a clue (does anyone know the gain on the HX5 Beam??).

I think there is still quite a bit of work to do on the tuning side, but plan on leaving it up for a month or so just to get a rough idea of how it works.

If all goes well, I then plan on making a MKII version, with individual feeds for each element (I don't like multiple feed systems, and envisage that individual feeds will improve performance and make tuning easier, by decreasing the interactions between elements).

So there you go. All up cost of the Mk was about $60US (including an extra set of spreaders), and I would imagine the completed MKII should total at around $100, with more sturdy wire elements and longer term construction methods. It's still too early to talk about performance, but I seem to be working everyone I call and performance in the recent RTTY ARRL Round-up was encouraging (with 50watts). I'd like to improve the F/B ratio a little, but don't expect the Hex to match my old Moxon Rectangle which is noted for its excellent F/B ratio.

In summary I'd say that the important parts are having good quality spreaders that will tension the wires correctly and obviously not snap them. Have good quality wire, and have some method to minimise the chance of breakage at the connection points. The actual tuning is pretty straight forward, and whilst I have heard it said that tuning of the antenna is very (very very!!) critical to performance, I really believe that good performance can be achieved with minimal effort and a little fiddling about (and will take some convincing otherwise).

So there you go, a Hex-Beam on the cheap!!

David

230. Tip spacing

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-08 11:28:11 UTC
From: David Douglass
Topic: 230 Message: 230

Hi Doug and thanks for your comments.

OK on the tip spacing. Although it's difficult to tell on the photo's, the tips are actually a lot closer together, but the end bits of the elements are taped to the green string so you can't see them. This was my initial effort to allow pruning of the elements without having to restring the whole array everytime I cut a little off.

Whilst they are not quite the dimensions suggested in Mike Traffie's paper, they're actually pretty close, and I plan to follow his design a little more closely when I put the new wire up and feed each of the elements separately.

Regards to all from hot and sticky NSW

David

Hi Dale,

You need to log in on http://groups.yahoo.com/group/hex-beam and click on the Photos selection in the left panel on your screen. This is how you access files and bookmarks too.

From: w4wb
Topic: 234 Message: 234

Below are the HXCC Award rules. They were developed by WB6ROH, N0YD, and W4WB. Please send any comments for improvements to W4WB.

A copy of the rules can be found in the Files section in the HXCC Awards folder.

Thanks es 73,
Barry - W4WB

HXCC Rules

OBJECTIVE: The HXCC Award is to recognize the achievement of working at least 100 band-stations that are using a HEX-BEAM type antenna. The 5BHXCC Award recognizes the achievement of working at least 100 stations on each of any bands.

Award: A certificate of achievement will be issued to those qualifying.

Rules:
1. It is based upon the honor system, QSL cards are not required.
2. You are not required to be a HEX-BEAM owner or using a HEX-BEAM to participate. Only the station you work is required to be using a HEX-BEAM type antenna.
3. A HEX-BEAM type antenna means either a factory built HEX-BEAM or a homebrew antenna that utilizes the basic design of the HEX-BEAM.
4. It requires 100 points to qualify for the HXCC Award.
5. There is no time limit on the contacts you make, e.g., a contact in 1997 is valid.
6. Only contacts you make from your stations operating within your entity, as defined in the DXCC rules, will be considered valid.
7. A point is defined as working a station (not an operator) using a HEX-BEAM on a given band. For example, working the same HEX-BEAM station on 18 m, 12 m, and 10 m counts as 3 points. Working different operators at the same physical station does not count as extra points.
a. You are required to submit a list of the contacts that has the following data:
b. Date
c. Time
d. Station call sign
e. Freq/Band
f. Mode
g. Reports
h. Op Name
i. HEX-BEAM SN if known or if homebrew
8. 5-Band HXCC (5BHXCC) requires 100 points per band (presently 6,

10, 12, 15, 17, 20, 30, and 40 m bands have HEX-BEAM operation).
9. Excel electronic file submittal is desired.

Certificate Request: Submit your data to W4WB.

"HEX users can't be SQUARES or ever OBTUSE since HEX-BEAM ops are more ACUTE"

I've just worked A35VK on 80M, 40M and 30M using my Homebrew Hex - does that mean it qualifies as 8 bander and if so how much must it be worth??

Wonder if anyone else has worked any DX "out of band".

Regards

David

WOW David! What I don't understand is that you didn't make the contact on 160 m too! hi hi Impressive.

FWIW, I will take the 259B to the office today and scan my HX-5B over the 30, 40 and 80 m bands, and see what it looks like. OK, will look at 160 m too. :-)

Wonder if it is that Tasmanian Oak you are using? Ummm.....

Barry,

I would think that my coax is doing a fair share of the radiating, but I know that the performance on 30M seems OK, and have worked Europe from here on that band with the Hex. There is quite a bit if wire up there, and I know someone who works a lot of DX with his 5 band quad on 80M.

To be honest - A35 is only about 3500Km from here, so its not really DX, but this is only my 6th country on that band as I've never had an antenna for 80.

Regards to all

David, VK2DPD

What type of T-match do you have between your rig and coax? Have you tied the center and shield together and fed the whole thing as an end-fed wire?

Hi Doug,

Well, strangely enough I can tune 80M with just the rigs internal tuner, although I need an external job for 30 and 40M.

I had already mentioned to Bill that the Hex seems to radiate OK on 30M, and that I have worked about 80DXCC on that band using the 20M element on my old wire Moxon.

I wouldn't like to hazard a guess which parts are radiating on these other bands, and would suspect that performance on 80/40M will be very poor, but Tonga is pretty close to here, and if you don't have another antenna, it's better than nothing.

Regards

David

Hi David,

I measured my HX-5B today and it showed a SWR of about 12:1 on 30 m and >25:1 on 40 and 80 m. With a tuner, I should think I could match up on 30 m, but have no idea how it would work.

I think you must have the World's record for number of bands from this type antenna!

73 de Barry - W4WB

241. I worked with BV on 30m

From: jr1nhd_shin
Topic: 241 Message: 241

Hi,

Following David, I could work with BV/DL3KR on 30 m last night.
I used FT-1000 internal tuner. He gave me 579 and I sent 559.
I am not sure if this is the normal signal strength from Taiwan
with the matched antenna; anyway I made it. JA to BV is like
VK to A35, hi. I could also tune 40 and 80 m easily but did not
try these bands.

73, JR1NHD - Shin

Hi Shin,

Congratulations! What's next?

Isn't the FT-1000's internal tuner range 3:1? The MFJ-259 showed the SWR on 30 m for my HX-5B well outside the range for the tuner in the FT-1000MP. On 40 and 80 m, it was very high SWR. Ummmm.....

Did you observe any directivity?

Hi Barry,

Tonight I worked with WA7CWM at Nevada with 579-579 on 40m. He was
running 500watts while I was running 100watts cos I was afraid of
any interference radiated from coax. I feel some directivity but not
sure if it is because ofthis beam or QSB. I also tried RV6 station
on 30m but he could not copy my callsign.
so mine is HX-7Bi now hi.

Just found out about this group a couple of days ago. I wish I had all of these resources last summer when I built my 10 meter version using pvc for the spreaders and a piece of wood for the center hub. I built the antenna in a few hours and put it up the next day. It was virtually a plug and play project. Never had to adjust the lengths for matching. It was very impressive when compared to my 14avq vertical. Usually gives a 2-3 s-unit gain over the vertical and a 5-6 s-unit front/side ratio. f/b is a couple of s-units which leads me to believe that I could do a bit of tweaking with the reflector which is only about 3% longer than the driven element. By the way, the antenna is only up about 10 feet off the ground. I am still trying to figure out how to get it up higher. A tower is not an option. I am trying to keep a low profile going. I hope to visit the net tomorrow depending upon my schedule.

After reading Shin's post, I just had to see if my FT-1000MP would load up my HX-5B even though the MFJ-259B indicated very high SWR.

Confirming Shin and David's experience, my MP loaded up OK. In fact the MP's SWR meter indicated less than 1.3:1! Not sure why, but I'll accept it and use it.

Next I decided to see if I was having low blood sugar or something and not reading the meters correctly. I gave a single CQ using only the FT-1000MP at 100 W (US hams are limited to 200 W on 30 m). W0LSU in MO came back with a 599 report. He was 579. I told him what I was doing and turned the beam 180 degrees. He reported that the signal dropped to a 589, but the the 599 was really with a plus on the first 9! While he was replying, I rotated the beam back towards him and passed through a null it seemed. At first, I figured that the HX-5B might behave like a dipole sort of, but no, it still is acts like a beam!

Unbelievable!

OK, not to be faint of heart, I gave 40 m a go. In the phone band, it was a bust; however, the old MP loaded up nicely in the CW band with the minimum SWR (near 1:1) at 7.050 kHz. I have not tried operating yet on 40 m with it (band was dead it appeared at that point except for a few "local" guys on phone). No idea if it will show directivity, but at this point, I am expecting it too. hi hi

Thanks to David for my "new" 30 m beam!

Yes Tom, all were grounded. I also heard a station just now on 40 m CW and the old HX-5B showed about 1.5 S-unit F/B. On 30 m, the R=7 and the X=32. Appears that these are in the range for the MP's tuner. Most interesting antenna.

First post to this new group.
I am buying the 5 band model and looking for the appropriate tower.
What is the windload of this antenna?
Do you think I could get by with this http://www.texastowers.com/b14.htm?
Universal tower
Model B-14
Aluminum
Free-Standing
30' tall
4.5 sq. ft. wind load

Thanks
Barry

Hi All,

Just had a listen to the net frequency but nothing in this part of the world. I then realised that 22:30 on Saturday is actually Sunday in this part of the World, so missed out by a whole day??

As for 30M operation, I've had a lot of success on this band using my old wire beam and I suppose that the Hex should not be too dissimilar.

I thought in theory that the antenna should radiate in the opposite direction to the other bands as the 20M reflector would act as a director on 30M. However, this didn't really seem to be the case and it turned out to be pretty omni-directional. To be honest, another reason operation will seem OK on this band is that not many stations are using 'BIG' antennas down here, and therefore you have more of a chance to compete. Also being CW only, signals are a lot more likely to get through, as everyone know CW is by far the most effect mode!!! (no arguments please!)

As for 40/80M, operation on these bands is pretty much novelty value only, and all I've ever worked here is Pacific stations within about 5000Km. Then again, if you don't have an antenna for these bands its better than nothing. Doug's suggestion of shorting out the coax at the radio and using it as a top loaded vertical could be a go, but I have a metal roof on the shack and half of the coax is underneath it so radiation will not be too good, although I do plan on giving it a go. I suppose you could also look at using your tower as the radiator and the Hex as a capacitance hat, although I suppose you would then need to use relays to short out the antenna to the tower and things then get a bit technical.

Anyway, good luck with the experimentation and CU on 30M and hopefully the 10M net tomorrow.

Hi Barry,
Somewhere (maybe on the www.hexbeam.com FAQ) I have seen that it is about 5 sq. ft. I haven't calculated it myself, but that number seems high. That is a nice little tower. Have you considered an crank-up, tilt-over like one from Aluma Towers?

Yea, That looks good. But could not find a price list.

Originally was looking at a similiar tower from US
Towers(TMM-433s)http://www.ustower.com/selfsupport.html
$1200

10-12 week lead-time was a turn-off.

255. SWR numbers

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-12 03:23:23 UTC
From: Meiselman
Topic: 255 Message: 255

Hello to all!

I realize (I think) the danger of focusing too much attention on SWR numbers rather than just using an antenna. However, since I just put up my HX-5B last weekend, and since I seem to have several devices that claim to measure SWR, I fell into the trap of doing the measurements.

My system is a Kenwood TS570D into an Ameritron 811H into a MFJ 986 tuner into a Daiwa CN801 "professional" meter into 100 feet of 9913F coax into the HX-5B. In addition, I am able to connect a MFJ 259B analyzer at the beginning of the 9913 coax. For the tests below, the Ameritron was turned off (its power switch off) and it was in the "bypass mode" so that it did not act as a tuner. Also, the antenna tuner in the Kenwood was turned off. 80 watts CW (just long enough to get a reading) was the test signal from the Kenwood; the MFJ 259B provides its own signal.

For the results below, the four SWR values at each frequency are the values obtained from: 1) the Kenwood graphical display; 2) the meter on the MFJ 986 tuner; 3) the Daiwa CN801 meter; 4) the MFJ 259B analyzer.

28.300 1, 1.4, 1.8, 2.4
28.500 1, 1.9, 2.4, 3.1
28.700 1.2, 2.4, 2.9, 4.0
28.900 1.6, 2.5, 3.5, 4.9

24.930 1, 1.3, 1.6, 2.1
24.990 1, 1.2, 1.5, 2.1

21.200 1.2, 1.4, 1.6, 2.2
21.450 1.2, 1.4, 1.7, 2.2

18.100 1.6, 1.8, 2.0, 2.6
18.168 1.6, 1.6, 1.7, 2.3

14.150 1.6, 1.8, 2.1, 2.8
14.250 1.3, 1.6, 1.8, 2.5
14.350 1.2, 1.4, 1.7, 2.5

As you can see, the Kenwood meter is the most "generous" or "optimistic", whereas the MFJ 259B analyzer gives the "worst" information. The MFJ analyzer is fairly new (about 1 year old) and seldom used, so I'm not sure why it gives such high SWR values.

OK...now what? I guess if we ignore the MFJ analyzer data (the last value for each frequency), then the only area of concern is at the higher regions of 10 M (28.5 and above). Or do I trust the silly scale on the Kenwood and say all is OK everywhere? Hard to believe the Daiwa meter is bad, and also

hard to believe the segments on the Kenwood are the most accurate way to get SWR information.

Any comments from anyone would be appreciated. Any thoughts about why the MFJ analyzer is so high? Any tricks (or value) to lowering the values for 10 M?

I look forward to any and all responses, and also to meeting some of you on the net tomorrow.

Many thanks and 73,

Herb K6HJM

Herb,

I would find it interesting to do the same test into a known 50 ohm dummy load with just a 50 ohm transmission line.

I'm using a 756ProII and have a MJF Tuner/SWR meter and the MJF antenna analyzer. I'll try a similar test this weekend and see what results I get.

Brad:

The mystery continues! Using a 50 ohm dummy load, the MFJ analyzer reads 1.2 to1.3 over all the bands. Also, with a 50 ohm load, the Kenwood segments indicate 1 and the meter on the MFJ tuner shows 1.1 to 1.2.

SO...the MFJ seems strange in real use, but not with a dummy load. Maybe I'm the dummy?

Topic: 255 Message: 258

Herb, you are not a dummy but making a minor oversight in the theory relating to SWR. It sounds pretentious to give this explanation, because by nature it is technical, but I'm merely providing some reasoning for the different readings being obtained (note that they are being obtained at different points in the feed from antenna to radio - that's the clue).

In brief: when a transmission line is terminated by a resistance value equal to its characteristic impedance (as in a dummy load and a short length of coax), there is no reflection and the SWR will at or near unity at any point of measurement. But when the line is not correctly terminated (though strange to say, as when connected to an antenna - even one near resonance), the voltage to current ratio is not the same for the load as for the line and the power fed along the line cannot all be absorbed (or radiated). The forward wave and reflected wave interact all along the line to set up a standing wave. Although not a pure sine wave, it is sinusoidal. I can't draw a sine wave here but I'm sure you know what its characteristics are. Depending on where in the wave you take the measurement will determine the SWR reading. In other words it will vary and in fact if you took enough measurements it would go up to a peak and drop again.

Manufacturers of modern transceivers use a technique to ensure that the near lowest SWR on the line is what the meter reads. The MFJ reads true for the position in the line that you have placed it providing it is also indicating the correct resistance of the line. Usually it will only do this if the line length is very short. The true SWR (of the antenna) is therefore only correctly measured by a MFJ analyser and only at or near the antenna ie with just a few feet of coax attached. Other measurements at other places in the feedline are misleading.

Enough sermonising, this is meant to be about Hexbeams. Hope no-one takes offence.

Eric G0CGL.

Hello all,

I've posted some photo's of my installation. Look in the Photos section under the KU7Q album.

I used 30' of 1-1/4" rigid conduit for the mast, in a tilt-up configuration. The "foundation" is a cement post block (the kind used to anchor 4x4 deck posts). The entire assembly was easily pulled into place by two people, me pulling on the rope and the XYL guiding the mast into position. The house attachment was made with Uni-Strut & conduit clamps. I braced the top of the mast to the roof using 3/4" thin-wall conduit for struts. The last photo shows the street-side view. So far only one neighbor has noticed it :)

The nice thing about this configuration (besides costing less than $100) is that the whole thing can be brought to the ground for repair and maintenance. I only need to climb onto the roof to loosen the strut brackets.

73's, Lynn KU7Q

263. Many thanks

Topic: 263 Message: 263

Just a brief note to thank those who helped me escape from my "dummy load" situation. Special thanks to Eric (G0CGL) who provided very interesting comments. I understand the concept of different readings along a transmission line, but am still amazed at my results. The Kenwood meter, the MFJ tuner and the Diawa meter are connected in series, with only 3 feet of 50 ohm coax between the Kenwood and the MFJ tuner and another 3 feet between this tuner and the Diawa meter. Anyway, since I can't do anything about these SWR values...I will just relax and enjoy the antenna.

Also a "thank you" to those on the 28.356 net yesterday. Was great to put voices with names...maybe someday faces with voices?

Yes, I noticed that the snow was mostly gone from the roof and the temp was above freezing so I went for it (still a foot of snow on the ground).

Haven't had any time to give it a serious try yet! I missed the sked last Saturday because I was putting the antenna up, but I plan on being on this week.

BTW, the beam looks great on the MFJ antenna analyzer on all 5 bands, (below 1.7 SWR on all freqs). It even dips down to 1.8 SWR /55 ohms on 53 MHz and 1.7 SWR / 55 Ohms on 145.4 MHz! My LDG Z-11 tuner gets it on 40 and 30 mtrs too, and it shows some directivity on those bands as well. This seems to be a great antenna for someone like me that can only get away putting one antenna in the air.

73's, Lynn KU7Q

267. Use of MFJ analyzer

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-15 18:16:39 UTC
From: Herbert Meiselman
Topic: 267 Message: 267

I just read the email message from Lynn (KU7Q) in which he provides outstanding SWR values determined via a MFJ analyzer (model 259B I assume).

His values are so different from mine that I wonder where I have failed!? Of course, mine were measured at the end of 100 feet of 9913 flexible coax (Cable-Experts stuff), with 7 turns of coax on a 4.5 inch plastic core just below the rotor on a 4.5 foot Glen Martin tower. There were also 3-4 turns of the coax on the flow near the transmitter (just extra length of coax that I did not want to cut off right now). The MFJ analyzer was grounded, but only via the coax shield...I had a short piece of coax between the MFJ and an Alpha-Delta switch, with the 9913 connected to this switch. The switch body was connected via a separate wire directly to a ground.

Anyway, my MFJ values for SWR were

28.3 = 2.4
28.5 = 3.1
28.7 = 4.0
28.9 = 4.9

24.93 = 2.1
24.99 = 2.1

21.20 = 2.2
21.45 = 2.2

18.10 = 2.6
18.16 = 2.3

14.15 = 2.8
14.25 = 2.5
14.35 = 2.5

These MFJ readings do not agree with Lynn's. I do realize that the best way to measure the ANTENNA'S behavior is by using a short piece of coax, and that with 100 feet I am "seeing" both the antenna and the coax. Still, my MFJ analyzer numbers are so different from Lynn's (and from a Daiwa CN801 meter) that I am still puzzled. [more data than you could ever want in my 11 Jan, 2002 email to the group!]

Comments, answers, requests to shut up and go away, etc, etc?

I admit to being confused by some of the SWR readings folks are getting. Assuming a lossless line, SWR will not change regardless of where it is measured. Perhaps the measurement will change due to inaccuracies of the particular meter. If the line is "lossy" SWR should decrease with distance.

It is known that the wide band SWR meters are in general susceptible to strong external RF fields such as a local radio station, etc. It would be interesting to hook up a dummy load at the end of the 100 feet of 9913 and see what readings you get.

The answers are in my email on the subject. For reference check out your own ARRL's books on the subject. We here in the Royal Signals section of our military service actually refer to them more often than our own manuals!

Subject: [hex-beam] Use of MFJ analyzer

I just read the email message from Lynn (KU7Q) in which he provides outstanding SWR values determined via a MFJ analyzer (model 259B I assume).

His values are so different from mine that I wonder where I have failed!? Of course, mine were measured at the end of 100 feet of 9913 flexible coax (Cable-Experts stuff), with 7 turns of coax on a 4.5 inch plastic core just below the rotor on a 4.5 foot Glen Martin tower. There were also 3-4 turns of the coax on the flow near the transmitter (just extra length of coax that I did not want to cut off right now). The MFJ analyzer was grounded, but only via the coax shield...I had a short piece of coax between the MFJ and an Alpha-Delta switch, with the 9913 connected to this switch. The switch body was connected via a separate wire directly to a ground.

Anyway, my MFJ values for SWR were

28.3 = 2.4
28.5 = 3.1
28.7 = 4.0
28.9 = 4.9

24.93 = 2.1
24.99 = 2.1

21.20 = 2.2
21.45 = 2.2

18.10 = 2.6
18.16 = 2.3

14.15 = 2.8
14.25 = 2.5
14.35 = 2.5

These MFJ readings do not agree with Lynn's. I do realize that the best way to measure the ANTENNA'S behavior is by using a short piece of coax, and that with 100 feet I am "seeing" both the antenna and the coax. Still,

my MFJ analyzer numbers are so different from Lynn's (and from a Daiwa CN801 meter) that I am still puzzled. [more data than you could ever want in my 11 Jan, 2002 email to the group!]

Comments, answers, requests to shut up and go away, etc, etc?

Eric,

You're original message contained the following statement:

> Depending on where in the wave you
> take the measurement will determine the SWR reading. In other words it
> will
> vary and in fact if you took enough measurements it would go up to a
> peak and
> drop again.
>

This is simply not true, if it was, SWR curves on a Smith chart would
not be a circle. I do agree this is a hexbeam reflector, so I am more
then glad to continue this discussion with you off line if you wish.

regards,

chris, n4vi

Hi Chris,

It is true, I think your own assumption is misleading you. Whilst you are quite correct, the assumption doesn't apply because of the losses that do exist and the fact that antenna is anything but a purely resistive load. Since I been teaching this theory to Army personnel for 20+ years I think I can say I'm qualified hi. No need to continue this further, it will only serve to confuse people more than they are.

By the way, we have a professional piece of kit to analyse our military arrays, it shows up the shortcomings in the MFJ quite remarkably.

Best wishes,

Eric.

273. SWR or VSWR

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-16 01:52:27 UTC
From: w4wb
Topic: 273 Message: 273

FWIW, it is just fine to discuss SWR, feedlines, RFI, or whatever as long as it is reasonably related to antennas (hopefully the HEX-BEAM).

If you really want to learn more than you might like to about this subject, get a copy of "Reflections II" by W2DU (see http://home.iag.net/~w2du/). It has just been released and may be in a ham store near you.

275. 6 Meter Hex-Beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-16 05:12:43 UTC
From: AB4WL
Topic: 275 Message: 275

I will operate as a rover station this weekend during the ARRL January VHF Sweepstakes using a 6 meter Hex Beam. I plan to operate from EM52, EM53, EM62, EM63, EM64, EM72, EM73, and EM74. 73, Ken AB4WL

276. Loss in Operating the HX-5B on 30 m

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-17 14:15:04 UTC
From: w4wb
Topic: 276 Message: 276

I decided to compute the total line loss for my particular HX-5B when used on 30 m since John W0LHU in MO had said my 30-m signal was so strong at 100 W.

I did the calculation for total line loss at 10 MHz, 60 feet of RG-213, and SWR = 10 (R=7 & X=32). It worked out to be 1.7 dB. The coax contributes 0.4 dB so the loss due to the SWR is just 1.3 dB. Quite acceptable.

The SWR on 40 m is even higher (around 25 as I recall at 7050 kHz), but the coax loss drops to about 1/4 dB. The total line loss is then around 2.5 dB (most due to SWR). Still very usable.

The impedance on both bands is still within the range for my FT-1000MP tuner so it happily matched.

I still ponder the observed directivity and F/B on both bands. On each band, there was no reversal in roles of the driven and reflector elements, i.e., beam direction was the same as for the designed bands.

It was a question asked someone asked. There are multiband beams that do have a reversal as part of their design. I still find it astounding that the HB seems to have gain and F/B on 30 and 40 m. But I'll take it!

Barry,

It is possible that you have f/b but not necessarily gain (as in gain over a dipole). Nevertheless, even f/b is good if it is a fairly efficient radiator which appears to be the case. It's always good to have another option in one's array of antennas.

Topic: 276 Message: 280

Hi Chris,

Good point, but in my initial playing with the HB on 30 m, I observed that it behaved like a beam in that it exhibited directivity in a single direction, had a reasonable F/B, and that the F/S was consistent with "normal" performance. By "normal," I mean that the signal decreased as the beam rotated and even had a good little null (ish) region. At no time did the signal remotely approach the signal level of that when the beam was directed towards the other station.

Since the total line loss appears reasonably small and the power has to go somewhere, it must be concentrated in the forward direction. This would imply gain I suggest. How much? Beats me.

Perhaps I can test it against a 30 m dipole sometime, but that will be a month or two at least. As you said, it is good to have another antenna option. I'm certain that this is nowhere near the performance of the full-size 30-m Hex-Beam. Hmmmm.... perhaps Mike has a 30 m HB up in the air and can compare at his QTH.

Next check will be on 6 m. Lynn KU7Q found the SWR on his HX-5B was about 2.5 on 6m. Given 60' of RG-213, this implies about 1.5 dB loss. I may just try it some on the 6-m contest this weekend. Who knows?

You're thinking in two dimensions. It's probably radiating mostly up, and less than a dipole in the desired direction.

Hi Barry,

I highly recommend using the HB on 6 mtrs. I have used it with my
IC-756 ProII and its internal tunner to work from Washington state to Europe
with no problems. nice to have a band I didn't plan on when I bought the
antenna.

My basis is just modelling lots of weird antennas at off frequencies. Lots of normal antennas, too. Most of the time antennas radiate somewhere, and not where you want them to.

285. Operating the HX-5B on 6 m

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-18 20:11:36 UTC
From: w4wb
Topic: 276 Message: 285

Hi Chris,
Well I tried 6 m this morning and worked a fellow a few hundred miles away with a good report. Band was just closing down he said. Maybe tomorrow will be better. I did notice that the HX-5B still acted like a beam, but never had a stable signal to make a performance guessimate from.

I was using a FT-847 and FC-20 tuner. The tuner happily tuned up on 6 m and I had 100 W output from the 847. FWIW, the FC-20 matched up on both 30 and 40 m too.

Even if the HX-5B is not fantastic on 6, 30, and 40 m, the simple fact that I can work those bands at all is great since I don't have antennas for these bands at the operating QTH.

Good show on your contacts!

OK, tnx. So far, I haven't seen a model of the Hex-Beam presented that has proper fidelity with respect to reality. Perhaps a bit more experimental playing by various folks will get a handle on how well the antenna is radiating off frequency.

Hi all.

Great talking with Doug at K6AA, Buzz (N5FTR) and Brad (K0TRL) on the Hex-Beam net this evening. Looking forward to my being more punctual in the future!

As just about every Hex-Beam owner I've spoken to has affirmed, the antenna has been quite a decent performer since I put it up. I started with the 3-band version (20, 17, 12 meters) back in Oct./Nov. of 1997, and put up the 5-bander (serial #4) in Aug. of 1998.

I won't bore anyone with country totals (unless you really insist!) but the antenna's performance has been rather remarkable.

Originally the antennas were on a 36 foot push up pole by Radio Shack, but a few months ago I put the beam up to about 45 feet on a military surplus crankup tower. I'm planning on getting it to 75 feet when weather permits, and I'll post the findings as to the effect on performance of the added height.

(By the way, if anyone knows who has "ad1y" on Yahoo!, please let them know I'd like to have that ID!)

73,

Tony, AD1Y

OK..so I forgot! Actually, I was out with relatives from the Palo Alto area...driving them to Malibu, eating good seafood, etc.

The Hex-Beam continues to work well, although I still worry (a bit) about its performance on 10 meters. Sometimes (like today), I receive a DX at a honest 59, but am unable to work the contact...and not because of a pileup. Since the 10 meter wires are closest to the top of my tower, I wonder if this could be a factor? The Hex-Beam base plate is only 6 inches above the top of my 4.5 foot Glen Martin tower...the tower is on the roof so the base plate is about 28 feet above true ground.

Hope to remember next week!

Thanks Barry.

I started in the hobby in Jan. of 1997. I've expressed to Mike on numerous occasions that the Hex-Beam made possible an accomplishment of which I'm fairly proud: in less than 3 years as a ham (Jan. '97 to Dec. '99) I put more than 300 (301 to be precise) entities in the log.

Having just "celebrated" 5 years in the hobby, the current totals are 318 worked/314 confirmed so far. (S. Sandwich went in the log on 2 bands yesterday with 1 call on each band.) I'm happy to say that the ever-popular P5 is among that total, having been worked last month on 10 meters.

The fact that Mike makes an antenna that can produce results like that while capable of being supported by a $65 push-pole and turned with a $69 rotator is rather remarkable to me.

I've since put it up on a crankup tower simply because it's physically easier for me to take it up or down, and because I'm interested to see what added height may do for it.

Anyway, I know bragging gets boring pretty quickly, but I think it may constitute pretty good testimony as to what the Hex-Beam is capable of doing.

Herb,

Given that your SWR readings are a little higher than some others, I would suspect that there is metal in some form reasonably close to the antenna. I would not suspect the tower stucture. Do you have parapet walls around or near the flat section on which you put the support? If so, are these stucco over expanded metal or "chicken wire?" Do you have any metallic materials in the roof supports? Do you have appreciable electrical wiring or any type of conduits in the rafters under the antenna? Do you have metal guttering? Any of the above can affect the take off angle and the VSWR. You gave us SWR readings some time back. Did you also record the R and X values. These may be of value in comparing with other users' installations and results.

I have installed the HX-5BI and have had excellent results.

I am debating whether or not to purchase the 40M Hex-Beam.

I would appreciate any user comments on this antenna.

Also if someone has installed the 40M with the 5 bander together, how did you do it?

73,

Jules VE3AKT

Tony,

That's very good going DX wise. As you didn't mention it, I assume this is without the aid of a linear?? Would this be correct.

From: ad1y1
Topic: 287 Message: 294

David,

Actually I do use an amplifier (legal limit when necessary) when the
pileup is howling.

However, much DX has been worked running barefoot. In fact I have
often been pleasantly surprised by the fact that I have worked a
station through a pileup while waiting for the amplifier to warm up.

73,

Tony, AD1Y

295. Homebrew DX

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-21 11:34:41 UTC
From: David Douglass
Topic: 295 Message: 295

Hi All,

Managed to work my second new country with the homebrew hex tonight (VP8THU). Not bad going for my pieces of wood and a mere 50watts, especially as the South Atlantic is pretty tricky from here. Goes to show that one can be homebrewed, and even work!!

Regards

296. An interesting rotor controller....

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-22 17:02:50 UTC
From: Floyd Sense
Topic: 296 Message: 296

I took Mike Traffie's original suggestion and bought a Channel Master 9515 rotor to turn my HX-5B hexbeam. It's a beefed up rotor with a braking mechanism and has spun the hexbeam for 18 months with no problems. I just learned of a neat new addition for that rotor, that also works with other Channel Master rotors and some Radio Shack models. It's the model 9537 infrared remote controller, which replaces the original rotor control with a new unit and it includes a remote control, similar to one for a TV or stereo. According to the information I've found, you can program in fixed compass settings for easy setting of the direction. It's not clear whether the new control unit is silent, or if it has a motor like the old one. If there's any interest, I'll fill in the details when mine arrives.

I found what I think is the best price on this new unit, $39.95, from Warren Electronics in Illinois. Here's a link to their page with the info if you're interested. Note that the model 9521 rotor, which includes this new remote, is also on sale.

299. Hex beam and Glen Martin Hazer???

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-23 04:01:33 UTC
From: Michael Melland
Topic: 299 Message: 299

Here is the dumb question of the day. I've not yet received my hexbeam. In fact I've never seen one but on the pics posted here. I assume the outer elements or cables are all around the circumference of the beam. So... I assume using a Glen Martin tower and hazer is out... no where to park the beam so the cables won't be in the way to lower or raise the beam ... is that correct ??

Mike

You have 60 degrees between arms to play with. If your hazer is dressed out sufficiently, I would think you could make a go of it.

So there isn't wire all the way around between the arms ? I know I can park a yagi to the side between elements and lower away.... I thought it looked like the hex wire elements were all around the circumferance of the antenna and figured they would interfere with the tower if lowered/raised.

Mike

Between two opposing 60 degree segments there are Phillystan tension lines. If you assemble the Hex onto the hazer fully lowered, you may be able to handle it.

Hi Shin,

Way to go guys! Hope we can all work David on Saturday. If 10 m is
not so good, we may try the other frequencies (+/-) listed on the
Home page for this site. BTW, you meant VK2DPD I should think. ;-)

Floyd,

I have the 9521A rotor with the IR controller. The controller is quiet and very easy to use. You have the option to recalibrate it automatically every 10 operations or on demand (it moves fully North the returns to the original setting). The IR controller is also a nice unit, my controller sits up on a shelf away from the op position. The only complaint I have with the unit is that it powers down after a minute or so of inactivity so you have to click a button on the IR control to wake it back up if you can't remember where you left it. Overall, I'm happy with the unit.

73's,
Lynn, KU7Q

Topic: 312 Message: 312

Hmm, That IR controlled rotator controller has been around for a number of years. I've had one for at least ten years.

Unfortunately, it's not clear that the new rotator motor (9521?) is as sturdy as the 9515, and I gave my old one away.

Does anyone else out there have the HXP and mast? I'm taking mine on a couple of trips this year, and have had the antenna set up for 20M on the roof for a few months. It was fixed north from here, and does make a difference compared to my R7 vertical in the favored direction. I clamped it conventionally, and the bottom of the antenna is slightly distorted, making it tight to adjust for travel.

In case you're wondering, the mast that Traffie sells seems to be the Portaple that's normally sold as a 26' unit for $200., with an extra smaller diameter piece to extend it to 30' and a coupler to the HXP antenna. It can be packed easily as two pieces 5' long. I'm going to get a ski case for the mast and antenna kit (as well as some cot and tent parts) for airline travel as checked baggage.

If you could locate a source of the spring-loaded parts, you could save a bit of money on a portable mast (or even build your own from aluminum tubing). Does anyone know what their nomenclature is, or a source?

73, doug

314. More on the Channel Master rotor controller

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-25 18:45:13 UTC
From: Floyd Sense
Topic: 314 Message: 314

Here's some more info on the Channel Master 9537 rotor controller I mentioned the other day. I received mine today and had it hooked up in about 10 minutes. The new control unit is a fraction of the size of the old one, about the size of a large thick wallet! It has an LED display on the front, to read out the compass heading in degrees, or the memory channel number. The remote control is a typical medium sized infra-red unit that takes a couple of AAA batteries.

You have a choice of two methods of telling it the position you want to rotate the antenna to. First, you can simply enter the compass heading as a three digit number. When you do that, the controller first displays what you entered, then displays the current heading as the antenna rotates. When it arrives at the right position, you see the heading you entered again. Optionally, you can set up memories to associate a one or two digit number with a heading - this was designed so you could enter a TV channel number. If you enter a one or two digit number instead of a three digit one, the controller assumes it to be a memory channel number instead of a compass heading, and sets the direction to the associated compass heading. To set the channel numbers, you simply set the desired compass heading, then press up-channelnumber-up on the remote.

The controller is almost totally silent, but you will hear a relay click once at the beginning and end of rotation. Power for the controller comes from a rather large 18VDC wall-wart power supply.

One drawback in my installation: I have things arranged so that the end of rotation is south instead of north. On my old controller, I just installed some labels on the face to reflect the new directions. On this controller, you're stuck with end of rotation being north, or 000 degrees. To circumvent this for now, I used the channel number memories so I wouldn't have to convert the compass headings. For example, north is channel 1, northeast is channel 2, etc. All I have to do for now, then, is enter the channel number that corresponds with the DX spot direction. Guess I'll have to climb the tower and rotate the antenna 180 degrees one of these days.

One responder to my original post said this is not a new product from Channel Master - it's been around for a while. My guess is - not too long since the paperwork with it has info on satellite TV systems. Anyway, the price is certainly right at $39.95 and the design/operation is much more than I had hoped for.

Hi Barry. Here are a few points to think about perhaps.

1. HX-5Bi is lighter by a factor of two than the KT36XA, has less than 50% of the turning radius of the KT36XA, has five band coverage instead of the three of the KT36XA, and likely has about the same general performance.
2. The KT36XA will require a stronger tower and more costly rotor. Windloading and torque due to wind is less with the HX-5Bi. Also, icing is surely more of a problem with the KT36XA.
3. Assembly of the HX-5Bi is minimal compared to the KT36XA (about 90 minutes for the Hex-Beam). No tuning required for the HX-5B, but you have to do so for the other.
4. Having the tribander at 70' as a requirement is not really valid. Many heavy-duty DXers have their workhorse antennas at 40', another tier at 60-70', and a final group at 90-100'. This provides a range of TOA and the higher antennas also form secondary lobes providing more coverage.

Hope this is of some help.

The tower is a US Tower model tmm 433-HD. It will support either antenna.

Rotor is a HAM V will turn either antenna.

Already ordered the Hex-Beam. I guess just a little buyers remorse as I am awaiting a 4 - 6 week delivery on the antenna. Leaves too much time to continue "drooling" over antennas. I hope the Hex-Beam was the correct solution. The KT36XA is awful big and sweet looking. Still time to cancel with that long lead time.

Thanks,
Barry

Hello Floyd,

I have an old AR-22 that has repeatability problems. It is top-mounted using the mast adapter common to this generation of rotators. Do you KNOW if the 9521 and its IR controls would be an upgrade or not? I am concerned about the ruggedness of the motor and gearbox as well as the apparent commonality of having to synchronize the system.

Hi Folks,

Its Mark, M5MDH, QTH: Eastleigh, Hampshire, England. Just a quick message to say hi and it looks like a interesting group, so i thought i'd join. I'll post occasionally but I'll be lurking mostly. I see the homebrew Hex of VK2DPD has really taken shape.. as I can't afford one at the moment... the idea of a homebrew Hex is really tempting. At the moment, i'm confined to indoor attic dipoles but i've managed to work in the region of 130-ish DXCC entities, so perhaps a Hex, might give me a little more punch...

Anyway 73 de Mark M5MDH

Welcome Mark,

Congrats on your stealth achievements and welcome to the Hex-beam users and wannabees site. Our Aussie member has done well with his project and there are a few 6 and 10 meter homebrewed Hexs on the mainland here also. Look for us at 2230Z on Saturdays on 28356. We could use a net and net control station on 15; maybe on 21356 at 2000Z on Saturdays or Sundays. Anybody game?

Hi David,

At about 0400Z, an A52 was on 15 m SSB (21.285 up). He was 51 to 52 here at the house (FT-847 and Titan vertical). Folks were saying there were going over the South pole. Am certain he will go QRT if I drive to the office to fire up the rig with the Hex-Beam. :-(

Often hear VKs on 20 m in the 0400-0700Z time frame. The VP8 boys are likely to fire up again within the next 24 hours. Hope you get them again from the S. Georgia Is.

Thanks for the note Barry.

I was actually working a few west coast US stations around 0930 on 10M RTTY, but when I came back from Brekkie, all was dead. Yep, would be good to get the from South Georgia, and think they are planning to stay for a little longer so should have a fair chance.

I worked a V51 mid-week for another new one here. Probably not too rare for you guy's in the US, but West Coast Africa is a difficult path from here.

Anyway all the best and CUL

David, VK2DPD

Hi Mark and welcome.

I wonder how big your loft space is there - maybe you could fit a hex beam in there??

I got an e-mail from a guy who has a 10M Moxon Rectangle in his, so suppose it could be done. An option could be to cut both elements to the same size and feed them both with twin lead and remotely tune them, to allow instant direction switching. That way you could support the wire elements from the rafters??

Anyway, good luck and see you on the band.

Hi David,
Thanks for another idea for a Hex,I sure i could fit a 12 metre,
possibly a 15m loft mounted Hex. It would also be quite cheap as
materials not ideal for such a structure mounted outside(such as
Bamboo canes for a monobander) could be used.

I have one of those DK9SQ 10 metre fibreglass telescopic masts and
was planning to make a Hex for use in conjunction with this mast
mounted about 3 or 4 sections down with the Hexbeam arms made out of
small diameter PVC tubing.

My thoughts for now,

Adios, Mark M5MDH

Hi all,

I've decided that I'll have a go at brewing up a 2 metre hexbeam as its very small size would assist me in the design concept for a HF Hexbeam and the fact it would be interesting how it would perform in 2 metres.

Adios, Mark M5MDH

Just fininshed a 6M version Mark with the first test a few minutes ago and looks good. I used 1/4 inch fiberglass rods for the spreaders three feet long. I got these at Wal-Mart. They are designed as caution flags to be attached to a bicycle. They are six feet long with a red orange pennant on one end and a metal bracket to attach to the axel of the bicycle on the other end. Both can be removed easily.

To hold the wires to the spreaders I found some 1/2 inch nylon spacers with a 1/4 inch hole and about 1/4 inch thick. I drilled and tapped them for a 4-40 set screw to hold them on the spreaders about 3/8 inch from the end. Then a trip to the local fishing supply yielded some #6 stainless steel "split rings". These are just a little greater than 1/4 inch in diameter and slip nicely over the spreaders with the antenna wire running through them attaching the wire to the spreaders. The tension against the nylon spacers seems to hold them in place but they could be glued if necessary.

Hope this gives you some ideas about yours.

73,

Brad--K0TRL

Mark,

I also have the DK9SQ pole which I use for a 40M vertical every now and then. I'm not sure, but would think that even with the top couple of sections removed it wouldn't be that sturdy. Anyway, good luck!

Hi David

Good idea for a loft mounted Hexbeam, I'm sure i could fit a hexbeam for one of the higher bands up there(such as 12 or 10m) and one advantage of a loft mounted one is I could very cheap materials for the frame such as bamboo, as it would not need the weather proofing a external one would.

I have one of those DK9SQ 10 metre, telescopic fibreglass masts and i was going to brew up a hex mounted about 3 or 4 sections down from the top with the frame made from small diameter PVC piping.. that'll be probably for the future..

Adios

Mark, M5MDH

336. VP8GEO

Topic: 336 Message: 336

WOW! When the VP8GEO guys came up tonight, the band went wild with DXers (and a few lids too).

On 20 m, the CW op was listening over a 10 kHz BW and the SSB op was listening over a 20 kHz BW. It was wall-to-wall.

I considered myself lucky to work them on 20 m CW and SSB. Since I expect the question of how many calls it took, I kept count. On CW, it took 6 tries. He was 549 at my QTH. On SSB, it took 9 tries and he was 53. The average S-meter reading in the calling freqencies was 20/9 and sounded like noise almost. The op was doing a good job pulling out calls and was keeping up a fairly good rate.

I made the QSOs using a FT-1000MP and Quarda (1000 W) with the HX-5B. Frankly, I don't think I could have made the SSB contact without a lot more tries if I had been running barefoot. There were just too many Big Guns on and I need to level the playing field, hence on came the Quadra. In a few days the Big Guns will be gone from the piles. I am going to try QRP about midweek with the Hex-Beam and FT-817.

GL on working VP8GEO on all bands.

338. Re: More on the Channel Master rotor controller

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-01-28 12:54:18 UTC
From: Floyd Sense
Topic: 314 Message: 338

The 9515 rotor was a beefed up model, with larger gears and some sort of braking mechanism. I've not been able to tell from the Channel Master literature whether the 9521 is made the same as the 9515 or not. Why not telephone Channel Master and see if they can tell you? I don't think the hexbeam will stress the rotor anyway. I've had television antennas that were about as big as a hexbeam, and the rotors worked fine for decades. By the way, I've never seen the need to synchronize the system as some others have mentioned. Don't know if that's because of the low turning torque of the hexbeam, or the ruggedness of the 9515. The new controller has a feature that optionally will automatically synchronize the controller and rotor every 50 times it moves.

Probably because of the consumer nature of the rotors, the paperwork that comes with it says nothing about the mechanical ratings of the rotor. I did see on their website that the 9515 was rated for 250 lb. loads. I don't think I'd want to put that type of load on top of any aluminum-shelled rotor without some sort of bearing above it to absorb lateral forces!

One good source of rotor durability information might be a phone call to Norm's Rotor Service (search the Web for number). He rebuilds all types of rotors and probably knows well how the various models fail.

From: Hal Williams
Topic: 339 Message: 339

I am on the list for a Hex from Traffie. Here are some of my preparatory decisions. I live in an uptight neighborhood with typical 100 x 70 foot lots in Camarillo, Ca. A permit must be taken out for any mast or tower, or you will just be taking it down a week after you have put it up. I have completed the zoning and building permit process and it was not excessive in any way. It cost $37.25 for the processing. I chose to go with a Rohn 50 foot push-up mast, nestled at 40 feet to soothe the neighbors. I already had an old lattice crank-up 52 foot tower but it is not necessary for the 20 pound Hex.

I have compared the Channel Master and Radio Shack rotators and they are the same units with minor variations; obviously made in the same factory.

The Radio Shack 15-1245 unit was picked for the following reasons:

1. The rotator unit has a heavy machine bolt holding the bottom plate on, not a tension clip that I saw on the Channel Master.
2. The rotator is painted gray, not neighbor-eye-sore-yellow as on the Channel Master.
3. The control head is a simple dial unit with AC cord. No wall wart or IR remote unit. I do not need an IR remote unit as I sit at the rig anyway, and I believe in the KISS formula (less complications to go wrong).

The whole mast will be grounded and shunt fed as a vertical on 160, 80, 40, and 30 against my extensive radial ground system (over 1,300 feet of wire) that is already under the lawn, driveway and etc. I am lucky to have access to lots of good used vacuum variables and relays and heavy coil stock for the shunt feed tuner as I work in radio broadcasting. I have done shunt feeds before, and if you have not tried it, you are missing out on a VERY effective antenna for lower bands. To minimize the noise on receive on 160 & 80, a folded dipole is stapled out of site on the rear wooden fence at 6 feet high and double balanced (2 coaxes) RG-6, 75 ohm coax comes into the shack to a small tuner for peaking on receive only. I have found that this makes up to 20 db difference at times on receive signal to noise compared to the random wire that I presently transmit on. I expect similar results compared to the shunt fed mast.

Hal, N6TZ

340. Ordered Hexbeam, Decisions to Make! help!

From: wo8usa
Topic: 340 Message: 340

I ordered my HX5Bi before New Year's. The backlog, supplies, and upcoming hamfest will keep my newfound friend away from me until mid February.

I would like to mount the beam on a push up mast at 20-30 feet. Rohn and Channel Master make one. I have seen the Channel Master at Lowe's (along with the Channel Master rotar) but I am leary of the actual strain the Hexbeam will but on it under a 50 MPH wind. I would prefer to avoid the tower but want safety.

I cannot house-support the pole at almost the top as others do--single story house here and will need to rely on guying. Any stories/suggestions as to how pole-mounted Hexbeam's survived the weather? Guying? Ground mount? Thanks for all in advance.

Hoping to have the Hexbeam in time for March,
Chris wo8usa@...

Hi Chris,
I have seen pictures of ice-laden hexs on masts on the hexbeam.com website. If you analyze a guyed tower/mast, you will find that if done correctly it is quite strong.

I purchased a fifty foot Rohn mast from an electronics dealer here in town. It is a standard item, but you may have to call around for it; try some of the old TV shops. I will leave it at 40 feet to increase the strength.

Lay out your yard on quadrille paper to scale and find where you can locate 3 guy anchor points so they are 120 degrees plus or minus 6 degrees apart. Then, measure how far the anchors are from the base of the mast and lay out the elevation angle on the quad paper with the distance and height of the tower. The angel of the guy should not exceed 55 to 60 degrees when measured with a protractor to the top guy point on the mast. (the lower sets of guys will be less angle)

Use 1/8 cable, NOT TV mast wire. Use thimbles so the cable does not get cut at the guy ring on the mast. Use two sets of cable clamps at each junction. Use quality ceramic EGG insulators (if egg insulators break, the cable stays looped thru each other). If you guy to a wooden point on the house or patio, make sure it is very sturdy and use an eye-bolt with washer and nut, NOT a screw-eye. Place turnbuckles at the bottom ends of the guys.

Two of my guys will go to steel fence posts that I will set in concrete, 30 inches into the ground so that 5 ½ feet of the 8 foot post is above ground. Then the 2 3/8 dia., 16 guage posts will be filled with concrete. Near the top, eye-bolts will go thru the posts and the concrete will then fill to the top. My third guy point will be built off of the house rafters.

Raising the mast takes 4 people, one lifting and three on the guys to keep it from folding. It must be done on a totally no wind day. All people must wear hard-hats.

I hope this helps,

Hal, N6TZ

Hi Chris,

Hal gave some good advice; however, I suggest that using wire guys has one significant drawback. Unless you are careful, wire guys can cause you problems by impacting your antenna's field. See most any antenna handbook. The load here is relatively light so you can use the black Dacron polyester rope made by Synthetic Textiles. AES sells it (see p. 133) for about $40 for a 350' roll.

As Hal said, if you can find three guy points about 120 degs apart, then go for it. In my case (see photo on home page of this site), four guy points were required due to the construction of the building we mounted it upon.

I have watched the antenna happily withstand 50+ mph winds without hardly any movement. Most interesting to watch during a storm.

Hal is absolutely correct about the minimum number of people to have available to raise the antenna/mast. A floater is also a good idea. Using the 50' mast for a 40' height is also wise; however, I suggest that rather than just not extending the upper section, that you consider using maybe about half of the upper section and then overlap the other sections to increase the strength (drill a hole through the mast for each section and bolt it in place).

CUL and 73,
Barry - W4WB

Fellow Hexers,

I got the following info from Channel Master tech service.
The "Bursma " link has a source for repair parts for these rotators.
I am not sure if they retail, but the have an "800" number that
interested parties could use to ask.

73 - Doug - WB6ROH

.....
This rotator is rated at 3 sq. ft for the maximum balanced wind load
area.
The maximum vertical load is 250 lbs. CM used to manufacture a heavy
duty
rotator model 9515 that was rated at 5 sq. ft. for wind load. You may
be
able to locate the heavy duty unit through CM distribution. Contact
Bursma
Electronics at www.bursma.com <http://www.bursma.com> or (6160831-

From: Brad Sumner
Topic: 345 Message: 345

Hi All

Well, still waiting for the real hex beam to be delivered but in the meantime as some of you know I have been working on a home brew 6 meter variety.
It is now installed on a ten foot guyed mast for tuning and testing.
Rotator by "armstrong", Doug.
Got some good measurements yesterday and perhaps the real test was two 59 plus 10 reports during a short opening between Kansas City and Alaska yesterday afternoon. I really have no experience on six so maybe this is routine but it was exciting for a first 6 meter qso with a new antenna. If the HX5Bi works as well I know I am going to be very happy with it.

346. Re: 2 Metre Hexbeam

Topic: 331 Message: 346

Thanks for the info Brad, its lucky that you have such a readily available supply of fibreglass rods- something I'm having difficulty getting hold. I found a uk website where you can get rods but the maximum diameter is 5mm, which should be ok for a VHF Hex but most likely unsuitable for a HF one.

Thats not the only problem I have here.. I also have EMC probs. My transmissions are breaking through on the telephone and one of the household HI-FI systems(don't know about the others) at 100 watts on the indoor dipole its quite bad but down to 5 watts its hardly noticable. I'm sure if its just the power overloading the affected equipment or RF getting down the outer braid of the Co-ax. I tried a small coax choke balun about 4 turns with a diameter of 10cm (this is probably insufficient) but no change... ah well such are the joys of Ham radio :)

Adios, Mark M5MDH

347. Optimum height?

Topic: 347 Message: 348

Buzz,

Using the model I have for the Hex-Beam on 20 m, indicates that at 35' there is a single large elevation lobe with the -3 dB points at about 12 degs and 43 degs. TOA is 27 degs. When you raise it to 50', the lobe splits into two. TOA is 19 degs with -3 dB at 9 and 31 degs. At 43 degs, a -15 dB null occurs and the peak of the secondary lobe is around 70 degs at -4 dB. Take these numbers as just guidance rather than accurate since I am still looking for model with good fidelity.

At 65', the first lobe has a TOA of 15 degs with -3dB at 7 and 23 degs, null at 33 degs, and peak of 2nd lobe (-2 dB) at 50 degs with (relative) -3 dB at 40 and 65 degs.

If you raise the antenna more, you will see more lobes. As you go towards 80', you see 3 lobes. Also, the TOA decreases, sharpness of the lobes increases (narrower elevation beams), and the nulls get deeper.

FWIW, it doesn't matter a lot if the beam is a Hex-Beam or a Yagi, the general behavior is the same. In modeling a 5-element Yagi at 35', it shows a single lobe with a TOA of 23 degs with -3 dB at 11 and 39 degs. Sound familiar? At 50', the TOA is 19 degs with -3 dB at 19 and 29 degs. A second lobe is starting to form, but is about 2 S-units down. At 80', the TOA is 12 degs with the -3 dB at 6 and 12 degs, a -20 dB null at 26 degs, and the 2nd lobe peak at 38 degs (-4 dB) with (relative) -3 dB at 31 and 46 degs.

OK, so what does all this tell us. It basically means that you get lower TOA as you raise the antenna, (elevation) beam gets narrower, and the beams finally splits into two or more beams. You also develop deep nulls (you don't hear or radiate well at these angles) as the secondary lobes form. 35-40' is an interesting compromise height. You cover most of the "workhorse" TOA, but suffer at the lower; however, you aren't throwing energy straight up and wasting it either.

Top DXers frequently have beams at 40', 65', and 90' (+/-) so that they can take advantage of a wider range of TOA and fill in the nulls! Look at the 5-element Yagi at 26 degs having a -20 dB null. If the DX station angle is 26 degs, you are going to be in trouble; however the Hex-Beam or the Yagi have their beam peak response there. So the high antenna will basically not hear that station but the lower antenna will do great. On the other hand, higher antenna will likely well outperform the lower antennas when low TOA are

needed.

Hope this helps you some. My humble suggestion is that you would do better overall by dropping to about 40'.

From: Meiselman
Topic: 353 Message: 353

Dear All:

As many of you are no doubt aware, there has been a continuing "K6HJM Saga" regarding my new 5-band Hex-Beam. It is mounted on a 4.5 foot Glenn Martin tower on the roof of my house (about 25 feet above ground) and can't go higher due to neighbors, XYL, etc. My "shack" is on the second floor of my house, with a long ground wire going down to two ground rods in moist soil. Had a RF choke at the top of the tower...7 turns on a 4.5 inch plastic core. Until very recently, I was having SWR problems, especially when reading SWR via a MFJ antenna analyzer. Values of 3 and even 4 on 10 meters!

NOW THE GOOD NEWS! Based upon many email and telephone discussions with Barry (W4WB) and email exchanges with Doug (WB6ROH), the SWR problems are gone!!!!!!!!!!

OK...here is what they told me to do:

1) remove the RF choke at the top of the tower (i.e., near the base of the antenna);
2) put 5 ferrite split beads on the coax just below the base of the antenna plus a couple more at the amp when the coax goes to the antenna..I used model FSB-1/2 from Palomar Engineers in California..also bought from them plastic cases/clamps for these beads which makes installation a "snap" (this is a bad pun since the plastic case snaps together to hold the bead on the coax...sorry!);
3) purchase a MFJ 931 Artificial Ground and connect it is series with the ground wire going to the ground rods.

Point #3 took some playing and thinking, since initially I had all equipment tied to a ground bus and the long ground wire attached to this bus. Now, however, the "DC and low frequency AC" ground is via the common electrical system in my house and the RF ground is through the MFJ 931 to earth ground.

THE RESULT: SWR less than 1.5 on all bands and over the entire SSB range for each band! In fact, most of the time the SWR is about 1.2 to 1.3 or better.

I hope some of the above is of interest to other Hex-Beam users. I also hope that Barry and Doug will accept my 1,000 "THANK YOUS" for all of their help and encouragement. They are great guys..someday perhaps we can have an eyeball-to-eyeball QSO and even a drop or two of good California wine.

73s to all,

354. 30 & 40 m Hex-Beaming with the HX-5B

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-05 18:26:19 UTC
From: w4wb
Topic: 354 Message: 354

I have been using the HX-5B on 30 and 40 m recently (since I have nothing else at that QTH on these bands). I have made a number of contacts on CW with good reports. Easily worked Europe on 40 m with the Hex-Beam's F/B and F/S helping quieten the QRM.

If any of you have a 40 m dipole or vertical or whatever, and also the HX-5B, please try to make a comparison and let us all know of your findings.

My guess is that it is behaving about like a dipole except that it has the pattern of a beam. F/B I see on 40 m is about 6-10 dB and a bit more on 30 m. Really weird. I'll take 0 dBd and directivity for free any day!

BTW, I am using a FT-1000MP and its internal tuner. Output shows 100 W.

Sounds very interesting Barry, gain on 5 bands plus dipole
performance plus on one boom for a extra 2 bands if i had the money
i'd buy one now!! As VK2DPD showed with his homebrewed Hex, 8 bands
is possible and as i need something for 40 and 30 as well its given
me some more thoughts :)

Barry, I can't get my Mark V tuner to tune the HX on 40 or 30. Any ideas. 73
de Bob K2WY

357. HX-5B on 40

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-06 02:25:41 UTC
From: buzzmann555
Topic: 357 Message: 357

I have a vertical that I had been using to talk to my mom (KA5BOA) in San Antonio. For whatever reason, we had not been able to talk on 75 with the vertical for some months now. I switched antennas to the Hex Beam and used the tuner in my FT-1000MP and we now speak every day on 75. It also tunes on 40. I would never have thought when I purchased the HX-5B that it would also play on 40 and 75. Bonus!
Buzz--N5FTR

358. Non-resonant operations

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-06 04:10:58 UTC
From: wb6roh
Topic: 358 Message: 358

Tonight after the FARM Net closed on 3937, I called the net manager, W7VPK, in Fallon, Nevada. I am south of Los Angeles in Carson. After establishing contact with my usual tuned-feeder-fed 1/2 vertical 1/2 horizontal 60' doublet, I switched to the HX-5Bi. The report was equal or stronger on the Hex. The internal tuner in my FT-1000MP was able to establish a 1.8:1 VSWR as far as the rig was concerned. If I was going to do this on a regular basis, I would probably use one of my outboard tuners. I tried the phone portion of 40, but was not able get the internal tuner to stop hunting although with about 10 watts outI received readable reports from stations in W4 and W6.

Doug - WB6ROH

From: w4wb
Topic: 354 Message: 359

Hi Bob,
I have no idea. Perhaps yours is just outside of the range of the Mark V. I have the MP (plain type) as does Doug WB6ROH. I note that the Quadra will not load, but it is fussy. My AT-11 and RT-11 tuner would FB with it too.

If memory serves me right, Shin has a Mark V and gets it to load. Might ask him.

Hi Mark,

Make that not 7 bands, but 8 bands. I have worked 6 m with it also using the FT-847 and FC-20 tuner. WAIT, Doug WB6ROH just email me that he has use his HX-5B on 80 m with good results! Make that 9 bands!

What's next? 160 m??? When will this madness end? hi hi

361. Hexbeam #201 arrived

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-07 23:16:52 UTC
From: wo8usa
Topic: 361 Message: 361

Well, Hexbeam #201 arrived Wednesday---folks at Traffie seem to be working overtime.

I do not believe any other antenna manufacturer would call you for 30 minutes on their nickel to tell you your antenna had just been shipped, and that if you do't like it, just ship it back for a refund.

Now I sure hope this antenna works! I plan to keep a log comparing the antenna with others I have and will provide the results here.

I will not likely get it up for a few weeks, but am hoping to be on the air for the March SSB contest. Hope to meet all on the net.

More to come--thanks to all who have posted install notes/etc here, I have saved them all.

73, Chris wo8usa

Hello to all:

Just got the email from WO8USA and I wish him good luck. The assembly is very easy, but I suggest two pairs of hands during the times the wire needs to be fastened to the arm "socket". Somewhat difficult to keep tension on the two ends and tighten the set screw...but easy with two people.

I don't know how high you plan to install the antenna, but if the SWR looks funny because it is too close to the roof, etc, then try some ferrite beads on the coax near the base of the antenna.

Mine is now working very, very well...just got two DX contacts that a friend with a tall dual quad was not able to catch.

73s,

Herb K6HJM

PS: Mike T. promises all of us a big lobster feed when we join him at the MA QTH (hi hi).

I AM SHOCKED!

I always assumed that ham operators were tough, rugged individuals who were unstoppable in their desire for HF and DX. Given this deep-felt belief, I am amazed with the two latest comments by new Hex-Beam owners! Wait a few weeks? Too cold? After the thaw?

What is this world coming to anyway? We in Southern California are out working on antennas in the winter and summer. We ain't wimps!

Buck up guys and get going!!

Wait a minute now Herb, I seem to recall you wimping out because of a little bit of rain. :-)

FWIW, I urge each of you to install either the air balun (RF choke) or the W2DU-type balun (ferrite beads) when you erect your Hex-Beam. As Herb said, locate it at or just below the base of the Hex-Beam. See files and bookmarks for this site for more info.

368. OK

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-08 01:20:16 UTC
From: Herbert Meiselman
Topic: 368 Message: 368

Well OK, maybe Barry is correct. I did not want to put the Hex-Beam up in the rain since Mike T. said this would frighten the antenna, thus rendering it unusable for the normal beautiful weather in So. California.

With regard to the ferrite beads, I got mine from Palomar Engineers in California. Their web address is: http://www.palomar-engineers.com/ The ones I used were model FSB-1/2 plus plastic "cages" or holders model FSB-1/2. The plastic covers are really nice since they hold the beads halves tightly together and also lock onto the 1/2" OD coax (RG-8). Takes longer to write about them to install them! By the way, Palomar also sells a bead "kit" with the same bead type plus shrink tubing to hold the assembly in place...cheaper, but you need to put it on the coax prior to soldering on the connector! That is, the coax goes through it and the beads are not split.

I am truly sorry if I offended any of the new Hex-Beam owners. It is just that we in the LA area are so macho that we assume all the rest of you are tough like us!

Again, 73s and best regards,

Herb K6HJM

Well, summer in Australia and big chunks of ice falling from the sky and very high winds. Thankfully the homebrew Hex survived intact, even though there are a few bumps on the car roof.

I've just about finished the new centre post and have cut the elements for the individual feed system and hoping to give this a try within the next couple of weeks. Still managing to work some DX, and have a total of 7 new countries with the antenna in a little over 1 month.

Vacuum, yes. Clear, blue? No.

Hexbeam #203 flies. WX was 14F, 40mph wind, snow. A blizzard blew in while I was up on the roof. That's what you get when you live at 9200 feet. Because of average WX conditions, the beam will not fly more than 6 feet above my roof -- total height is 28 ft at the base of the beam (about 31 on 20m?)

Yes, my wife took a picture of the moron on the roof. I got to glissade down, which saved me some time.

So far, it has exceeded my expectations. Reports on 17m (my usual band) have the 5 watts from my FT-817 at 59+ coast to coast, with a huge front to back. We may have some future hexnuts out there -- people were very impressed with the gain and F/B. I dare say, I'm one of the loudest 817's alive. "Long live the double A's!"

The blizzard came 10 minutes into the 20 minutes I was on the roof. It was blue sky when I went up the ladder. I was tightening down the u-bolts on the rotator when the gusts and snow started. In other words -- I wasn't stupid so much as stuck.

My wife took a picture right before it got bad -- I've uploaded it to the photos section.

BTW: In the category "Fun with Hexbeams":

1) I've raised the local repeater on 2m using the Hex (good swr, wrong polarization -- acceptable as a backup, I guess)
2) I've watched TV on the Hex. (Yes, it is very directional on channels 3 though 12 -- but I can't get any UHF at my QTH, I live in the boonies)
3) I've tuned up on 30, 40, 75, 80. (Z-11 tuner)
4) 6m is resonant around 51mhz. Hope my TS-2000 (when I finally get it in) will be able to tune it up.

385. Grounding

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-10 13:22:57 UTC
From: wo8usa
Topic: 385 Message: 385

Being a group I trust, I will seek a little advice outside the normal Hexbeam conversation on station grounding.

I do not have easy access to a "straight path to a ground rod or water pipe". What types of internal station grounding setups are used in Hexbeam land? I am trying to decide if I want to make a more elaborate setup than just "unplug" (and when I unplug, what do I unplug into?). Most hams I know seem to put a lot of confidence in the arc plugs or simply a glass jar they stick all their cables into.

Also, for antenna grounding (I am hopeful my Hexbeam will not attact lightning!) does anyone use anything more than a good ground rod to the mast/tower? I do not have static problems but want to protect against the lightning strike. We have had many cases near Dayton of strikes in trees ending up in the house.

Any practical tips would be helpful. I do not want to start one of those theoretical arguments on lightning but some practical protection setups which people in the group have used.

Planning continues for #201----I may now wait for a blizzard like #203 got!

Chris wo8usa

Hi Brian,

My TS-2000 will tune anything even remotely resembling an antenna on 6M
and the
other bands as well.

I've had my 2000 for over a year and really love the radio.

Wish I had a HexBeam!

From: w4wb
Topic: 385 Message: 387

Hi Chris,

May I suggest that you read Chapter 1 in the ARRL Antenna Book. It is time-proven material on grounding and lightning protection.

It is fine to discuss this topic on this list (within reason of course), but you can get MORE help than you could ever want on TowerTalk (http://lists.contesting.com/_towertalk/). Just remember, the advise you RX is worth at least what you paid for it!

FWIW, I will offer a few comments. First regarding lightning protection. I am a paranoid about this matter because I have seen the power of a direct-bolt strike. No little device will shunt this force; however, they can divert a near-direct strike induced currents (EMP). My approach goes back over 40 years when my Dad and I would toss the coax out the window into the yard (connecters had covers). Some of my friend have massive plates to connect the coax to for grounding. Outside is OK, but those that do it inside are still perhaps playing with fire!

Ignoring lightning for a moment, the issue becomes electrical and RF grounding. This can be a tricky matter. In fact, in our area, it is a Code violation to use dual grounds (the AC power ground and your own ham shack ground) for certain safety reasons. I do use a dual system because I planned it out when I built by home. In my case, the ground for the AC power system is located about 8 feet from my shack floor. I have a LARGE line running from it to a ground buss on the shack floor. This forms the connection for the single-point ground of my equipment. My electrical panel for the house is not more than 20 electrical feet away as well. This arrangement effectively eliminates ground loops unlike at most QTHs where the ham shack ground is remote from the AC power ground (and also addresses the safety issue of our Code). Hope that made some sense. It is sort of like what is shown in Fig. 16 in the ARRL Antenna Book.

A real issue happens when you have a very long run to your ham shack ground. This is also a formula for those nasty and often noisy ground loops. The equipment is looking for a RF ground. Fig. 14 in the ARRL Antenna Book shows one solution. Another is to use something like the MFJ-931 in the ground line (as close to the equipment as possible) to create an artificial RF ground. See the instructions for the 931 (you can download from the MFJ web site if you are not familiar with this unit). Note that the 931 provides an RF ground path, NOT an AC power ground path.

BTW, don't forget to use either a coax air balun (RF choke) or ferrite beads on your coax near the base of the Hex-Beam to mitigate RF on the outside of your coax shield. I prefer either #77 or #73 material, but #43 works (just not as well IMO).

Hope to hear you on the air soon Chris. Perhaps a snow storm is on its way to you now!

388. SPLIT CORE TOROIDS

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-11 02:52:57 UTC
From: wb6roh
Topic: 388 Message: 388

Anyone needing split toroids for 1/2" coax (RG-8, RG-213 etc.) should check out www.allelectronics.com. Where Palomar and others get better than $5 each, All Electronics gets the following for their FB-47:

1-99 = $0.50 ea
100-219 = $0.35 ea
220-659 = $0.20 ea
660+ = $0.15 ea

A friend picked us up some this week. We ran impedance tests with a MFJ-259B today. Data is concurrent with that expected for a #43 mix. Results are as follows with a single core and a single pass:

7 MHz = 78
14 MHz = 115
25 MHz = 173
100MHz = 144

I do not know if they have the nylon clip on covers. One easy trick to install these is to super glue their faces together. Make sure you get good facial alignment and exclude your fingers! You can leave them as is with a tie-wrap above and below the stack, tape them up or whatever pleases you. 5 or 6 of these stacked single pass on 1/2" coax will give you more than adequate common mode choking capacity.

Topic: 389 Message: 389

I have made an effort to improve the look of the home page for this Group in order to make it a bit more informational for new folks. Please let me know if you have any suggestions. I will likely change out photos from time-to-time if you have loaded yours into the Photos area.

I don't know about you, but I have been working a lot of good DX lately. Today, I got H40T (SSB)and 5T5PBV (CW). In the past few days I worked BY, UN, JT, 5U, 7X, 9Q, 3DA0, TF and that hot one, S07U (and hoping they have their paperwork proper this time so it will count for DXCC). All were worked on one or two calls with the exception of S07U on SSB. He had an odd tuning pattern and it took me a bit to sort it out plus four attempts.

Comparing the performance of the FT-1000MP with the HEX-BEAM to the FT-847 with a Titan vertical, it is no contest. Often I can easily work a DX station with the MP and HB, while not even hearing the DX station on my other station. I have these two stations about 4 miles apart.

390. H40T

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-14 05:56:05 UTC
From: Meiselman
Topic: 390 Message: 390

Hello to all:

Yep, even little ole me in LA got the H40T on the HB. Not bad considering the mountains behind my house.

I have been amazed regarding the amount of "RF current" flowing to my earth ground after I installed the MFJ-931. This is most notable on 20, 17 and 15 meters, whereas almost none is indicated on 10 meters. I have no idea if it helps with the signal getting out, but it can't hurt. Plus, the MFJ-931 provided another box with 3 knobs and a meter...and the needle on the meter moves when I talk. What more could I ask for?

Hi Barry

It is nice looking at the opening of Homepage. However I hope you willcorrect the last letter of my suffix from B to D. It is a small thing. BTW, next issue of "59" magazine in Japan will be a good exposure of this beam among JA DXers. It will have my posting about HX-5Bi. I will send one copy each to you and Mike.

I have recently worked VP8, 5U, H40, GD, 3V etc.but S0 and S9 were very far from my barefoot rigs even with this beam. I missed P5 on 20m RTTY last night too. You are far too good, Barry!!

Hi Shin,
Your call sign is fixed on the photo now. I am very sorry for the error. At least I had it correct in the text. Am looking forward to seeing "59." Thank you in advance.

Good DXing Shin. The S0 listens from time-to-time just for JA stations, but even then, there is a pile up. ALso, they can not operate from about 0000Z to 0600Z I heard him say yesterday due to local restrictions on power. Their signal is better than the 3V fellow's signal (think he is QRP), but well below the 9Q,5U or S9 guys. Good luck. We have difficulty with the P5 here. His operating time is not so good for propagation match from my QTH. Have heard him a few times, but weak. Have not tried him since he got the better antenna up. At our DX Club meeting, I think just one person (battleship station) has had a QSO with him.

Hope to hear you on the air again soon.

Dear All:

Well, in spite of Barry's proud achievements, we should not forget that other owners of HB antennas can also do some DX. In fact, some of us who are "antenna challenged" can play with the big boys (and girls)! Thus, even though "yours is bigger/taller than mine", remember it ain't what ya got but how ya use it.

Given the above, I am pleased to announce that the Meiselman Medal of Merit (MMM) has been awarded to me: worked JW7VK (Svalbard) yesterday and both EY8MM (Tajikistan) and 9Q1A (Congo) today. Even got a 59+ from 9Q1A.

Sincere thanks to Barry, Doug and others for making it possible for me to be awarded the prestigious MMM Award.

Dear Fellow Hex-Beam Owners:

The message below saddens me greatly, and I am thus moved to respond. I trust that many of you will join with me in order to help WB6ROH regain a sense of well-being and a more positive outlook on life.

As is clear from the message from WB6ROH, he suffers from an extreme case of "Antenna Envy". As you know, Dr. Sigmund Freud worked on a similar problem with his patients. However, Freud was only concerned with this single type of illness, and not with a combination of both Antenna Envy and MMM Envy.

I wish to assure WB6ROH that, in fact, he is eligible for the MMM Award. However, the road is long and difficult, and many hours of intense therapy are needed. Do not give up hope...the MMM could be yours someday!

With best hopes for a speedy and complete recovery.

Given that the majority of my personal DXCC friends believe that to run in excess of 100 watts is "morally illegal," I shall presume that one must subsidize the local utility company heavily to expeditiously qualify for the MMM (Meiselman's Maximized Megawatt)Award. Given that I already have DXCC x 2 plus, I will radiate forward with morally legal ERP enhanced by an appliance recognized for its ability to Hex all naysayers. Power to the "little pistols!"

406. New poll for hex-beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-18 13:28:52 UTC
From: hex-beam@yahoogroups.com
Topic: 406 Message: 406

Enter your vote today! A new poll has been created for the
hex-beam group:

Of antennas you have owned (or built),
how do you rate the HEX-BEAM's
performance,
installation/operation/maintenance
(IOM), and
stealth?
Installation/operation/maintenance
means ease of installing the antenna,
costs, how well it behaves once up, and
how much effort is needed to keep it
working and up in the air. Stealth
refers to footprint on the ground, and
spouse's and neighbors'tolerance to the
antenna. Please vote for only one
choice in each of the three topics.

o Performance: Excellent
o Performance: Above Average
o Performance: Average
o Performance: Below Average
o Performance: Poor
o IOM: Excellent
o IOM: Above Average
o IOM: Average
o IOM: Below Average
o IOM: Poor
o Stealth: Excellent
o Stealth: Above Average
o Stealth: Average
o Stealth: BelowAverage
o Stealth: Poor

To vote, please visit the following web page:

http://groups.yahoo.com/group/hex-beam/polls

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

Topic: 407 Message: 407

A poll is being taken in the Polls Area of this site. Question is as follows:

"Of antennas you have owned (or built), how do you rate the HEX-BEAM's performance, installation/operation/maintenance (IOM), and stealth? Installation/operation/maintenance means ease of installing the antenna, costs, how well it behaves once up, and how much effort is needed to keep it working and up in the air. Stealth refers to footprint on the ground, and spouse's and neighbors'tolerance to the antenna. Please vote for only one choice in each of the three topics."

Results are provided in real-time to you.

Tnx es 73 de Barry - W4WB

408. Little pistol Hexs another one.....

From: w4wb
Topic: 409 Message: 409

Good shooting Doug. Today, I worked PW0T on 12 and 15 m. Seems that he is having huge QRM from all of the stations calling him (his statement). He often works the upper end of the pile and this is why the pile keeps expanding in bandwidth! Once I realized what he was doing, I got him on the second call on 12 m and one call on 15 m. They are there for 9 more days, so lots of time to work'em on 5 or more bands.

Also, got a fellow in Georgia (the 4L type) today on 20 m SSB with one call and a 59+ report.

73,
Barry - W4WB

410. Poll - Please Read

Barry:

I can not believe the email you just sent to the HB group!

I worked my a-s off trying to respond to the poll, only to have the results of my efforts lost to the world. What a shock! Why did I do all of the research, data analysis, log reviewing, not to mention beer drinking, when my input was summarily rejected.

I guess it is OK for you big guys to devote almost all of your time to RF and ham radio, but I do not have that luxury...sometimes I need to eat and sleep and even say hello to my wife and kids.

Please let me know when it is safe to re-send data to your QTH.

Herb

From: n6tz
Topic: 412 Message: 412

Maybe I voted a little lower than the average did, but that is not to be interpreted as a criticism. I think Mike T. has done an outstanding job of developing the Hex. I also think that it would still sell like hotcakes based on the fact that it is a "darn good" two element compact design that deserves a good piece of the market share. It does not need to be promoted, supported, or acclaimed with "snowflake", "supergain", or "Holy inspired" types of adjetives. The advantages of this antenna speak for themselves when they are shown to Hams that are first looking at it. I have others looking seriously at it just from the facts of:

1. $140 push-up mast and guy wire for 40 feet.
2. $100 for rotator and control cable.
3. 20 pounds (9 kG.) of weight. (30 with rotator)
4. 9.4 feet (2.8 M.) turning radius.
5. Reasonable two element performance on 5 bands.

The only criticism I find are comments that "it looks like a broken umbrella".....but that is impossible to avoid.

So go for it Mike T., start promoting it with the facts and leave the fancy terminology along. Hams are leary of too much fancy promotion.

Hal, N6TZ

Hello again from LA!

I did go to the proper Yahoo web site and did vote in the poll. Also looked at the photos.

MY QUESTION: how do I get a HB with the bright red and yellow wires? Bet my wife and neighbors would love this new addition to their skyline.

Herb

PS: worked YO3ZA last night...first Romania for me!

Hi Guys,

It would appear that anything you guys can do I can also manage with my environmentally friendly Hex, as I worked PW0T on 17M this evening (even if it was on SSB). Even managed a VP2M on 30M, so the out of band DX is still going well. If anyone hears TI9M, tell him to point his beam to the Great Brown Land, as not hearing him yet.

Regards to all

Hi David,

Well done. The PY0T pile-ups are just chewing up the bandwidth! The TI9M operation is having a hard go of it presently. They had to operate on batteries at 50 W and then they went flat during the night. The park rangers have told them OK on now running a generator at night IF the noise isn't too bad. They have had to split the operation into two areas and it is VERY difficult to get the equipment to the 2nd operating area. The size of the beach originally planned was greatly reduced from what it had been. Give them some time and I'm sure you will get through. Good ops on the team.

An "environmentally friendly Hex?" What have you done now, painted it green? Thought it was silver painted. ;-)

Hi Hal,
Try to locate them together scuh that they are just below the antenna's baseplate. If you or anyone else needs these beads, All Electronics has them surplus for 50 cents each.

423. Ferrite beads

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-22 01:20:32 UTC
From: Herbert Meiselman
Topic: 423 Message: 423

I did not order the kit from Palomar Engineers, but rather 5 of their 1/2 inch split ferrite cubes (FSB-1/2). Also ordered the plastic cages that fit each cube and allow it to be positioned and clamped on the 1/2 inch coax.

As much as I hate to agree with Barry...he is right! Put the beads (or the kit) just below the baseplate of the HB such that the beads or kit are not parallel to any of the antenna wires. This is easy to do since the coax comes down the center post, over the top of the baseplate, then at an angle to the mast inserted into the bottom of the baseplate. Just put the beads/kit on the sloping coax immediately below the baseplate.

My HB continues to work very well, although I have discovered a small problem: if it is not connected to the transceiver it does not provide signals to that transceiver! This morning I was trying to hear some DX spots and got nothing...then I realized that the antenna switch was turned to my 40-80 dipole. Perhaps we can discuss this problem next Saturday?

73s, Herb K6HJM

PS: After turning the switch I got a new one...Moldavia! EK1QQ

Check out some of the beam books by Orr and you'll find that you want to tune your beam "low" to keep the reflector looking like a reflector and not like a director.

Checking out the simulations of small beams on www.cebik.com shows that the hex simulates to be a 2-element beam with a fairly limited bandwidth, so your experience doesn't surprise me.

Hi Hisashi,

I think David was saying his "complaint" with a bit of humor.

The TI9M boys have now solved most of their problems, have 2 amps on line, 5 HF stations and a 6-m station up. Concentration will now be a lot on SSB they stated in a recent message I read.

My HX-5B is tuned for CW, but works FB on the phone portion too where most of the DX is located. The performance curves in Traffie's brochure appear to reflect more of the operational performance I experience than do any of the simulations I have seen including LB's report.

Hey David, if you really feel bad about using SSB to contact TI9M, don't QSL. ;-)

Keep those reports coming from the "Great Green DXing Machine" from Down Under!

From: Herbert Meiselman
Topic: 427 Message: 427

Belive it or not, I had an idea!

Would there be any value in my stopping by All Electronics, buying a bunch of the cheap ferrite beads, then sending them off to the poor souls who do not live in LA? I'm not sure it would be worth it for foreign HB users (high postage costs), but maybe in the states?

Since the beads are so cheap at All...no charge for this service (maybe I can bill the domestic postage to my university?).

Barry,

I suppose your correct, any mode is better than none, but would like to get them on CW.

Not sure what is happening but Central America is usually a pretty good path from here but there signals are terrible, I can hear them on 15/12/10M at the moment but no better than about S2. Oh well still a while to go so may get them again before they head off.

Regards

David, VK2DPD

429. Re: SPLIT CORE TOROIDS

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-23 03:08:51 UTC
From: k0trl
Topic: 388 Message: 429

Hi Doug

I got my split beads from All Electronics and put together a test setup as you described in a previous e-mail. I compared the results to a split bead from Palomar that I had received in their RFI kit. My result proved your point that the beads are substantially the same and cost significantly less, however I got some different reactance readings. Mine are:

Mhz Yours AllElectronics Palomar
7 78 79 60
14 115 101 99
25 173 111 134
100 144 143 139

The big difference in my readings seems to be at 25 Mhz. Also interesting is your 25 Mhz reading of 173 which is quite a bump in the curve. I used about 8 inches of #22 stranded and insulated wire through the bead held together with plastic tape between the meter ground and the banana plug in the center of the coax connector.

I don't know that it matters much but maybe you or someone can suggest why the difference.

Howdy,

I don't know why the numbers are different. Our crew used an approximate 4" length of RG-58 with the shield and center tied together and the split was tie rapped. I doubt if that should make a big difference. I suspect that all of the cores were made by Fair Ite or however their name is spelled. The difference may be variations between analyzers or more likely variations in core materials. The All Electronics cores MAY be seconds. Given that most us will use 5 or 6 in line, the 500 or 600 ohm impedance should give us the desired results. I would defer to Barry, W4WB, for a potentially better technical assessment on this. I know he also bought a bunch of All Electronics cores. If he has an analyzer, perhaps he can run a similar test. Let me know if you learn anything more about these jewels.

I ordered 100 of them to share with friends. Should be here next week. Will test them out the following week. Too much work to play with them presently. I expect that All Electronics got them from a company that went under or surplused them. Also, Amidon was likely the manufacturer. Super price in 100 lot!

Hi David,
Tonight was the first time I have heard a strong sig from TI9M. They were 10/9 on 17 m SSB. One call was all it took. Message from them stated that they finally have all of the antennas up and working. Maybe they will turn the vertical your way soon. ;-)

Thanks for the info Barry!

Still not hearing him well here, so maybe just have to settle for that SSB contact.

434. HX-5B - two years later....

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-24 20:09:12 UTC
From: Floyd Sense
Topic: 434 Message: 434

Finally got up the tower today to check out my Hexbeam installation, about 2 years after installation. Everything associated with the beam itself looks just great and my flat black paint job (Krylon), which I applied very lightly, still looks fresh. However, a couple of other items mentioned on the group occasionally warrants comment:

1. I installed a new Channel Master 9515 rotor when I put the hexbeam up. Today I found that the long threaded studs used to secure the rotor to the mast were badly rusted in places, including a couple of the nuts and washers. A couple of the studs and associated hardware looked like new. Rather spotty quality on the plating I guess. Anyway, if you go the route of using a TV type rotor like this, it's probably a good idea to coat the hardware with something, or just bite the bullet and replace the hardware with stainless or good quality plated stuff before putting it up. The bolts and brackets that came with the rotor that secure the beam mast to the rotor look like new.

2. The split ferrite cores: I used several of the cores that are about 1 inch long, and secured with a plastic housing that clamps the cores around the cable. These cores were bought from All Electronics. The housings have a couple of small projections at each end, and these bear against the cable (RG-213 size) to keep the cores from sliding around. I was surprised to find that these tiny projections, over time, had made very deep indentations in the cable jacket and on close inspection, I found that a couple of them had actually penetrated the outer cable jacket. Not good! I use rather high quality cable and was not happy. If you use such cores on your feedline, I'd advise filing or cutting away those projections before installing the cores. I have another set of similar split cores and their housings do not have the projections. Certainly worth your checking this out before ruining a feedline.

The only problem I've had with the hexbeam installation in two years is that the spider-web construction is very good at catching small branches that blow off of a very large nearby sycamore tree. For those not familiar with the sycamore, in the winter time it sheds small branches like other trees shed leaves. At one point the hexbeam had caught several of them as they blew by. Another good reason to put the beam up above the trees!

Hello to all:

Sorry some of you could not make it on Saturday for the exciting HB Net and Fashion Show! I was there for about 10-12 minutes but had to leave due to "honey dos".

The ferrite bead story is becoming very interesting and I look forward to hearing more. As I recall, the plastic "cages" for the split ferrite beads from Palomar were of two types: 1) two were received last year as part of their RFI kit of rings and beads...these two are are on the coax right next to the amp and do not appear to be cutting into the coax; 2) five beads plus five "cages" I got about 2-3 weeks ago...these are just below the base of the antenna and so will require me to get on the roof to see if they are starting to dig into the coax. Stay tuned for the exciting news of Herb vs. the Roof!

I was fairly lucky this week: ER1QQ, CV1F, H7DX, TI9M, 4L1W, YL2GP, 7Z1AC and XW0X. However, the antenna seems to be having some problems...I had to call 3 times on the pileup for 7Z1AC and XW0X, but Barry says 2 is the nominal normal number. What could be wrong? (hi hi)

Belive it or not, I had an idea!

Would there be any value in my stopping by All Electronics, buying a bunch of the cheap ferrite beads, then sending them off to the poor souls who do not live in LA? I'm not sure it would be worth it for foreign HB users (high postage costs), but maybe in the states?

Since the beads are so cheap at All...no charge for this service (maybe I can bill the domestic postage to my university?).

Gordon:

I suggest you wait a bit until "Uncle Barry" has studied the bead situation. Apparently there are difference between those sold by Palomar vs. All Electronics. Also, I think "Uncle Barry" has ordered 100 of them, so he would be the more logical contact. In addition, "Uncle Barry" is blessed with $$ so no need to worry about costs.

73s,

Herb

PS: not really sure about the $$, but the rest is true!

442. New to group - help mounting suggestions

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-27 07:41:53 UTC
From: ve7ckz
Topic: 442 Message: 442

Hi,

I am new to this group. I just ordered a 5 band hex-beam a couple of weeks
ago, and can't wait to get it. I will be using a Yaesu light duty rotator
and a fibreglass mast. Does anyone have any suggestions on the following:

1. Guying the 30 foot mast. Guy rope material? Anchoring the guys?
2. Mounting the rotator/base of the mast?
3. Lightning protection?

Any help would be appreciated.

Hi Todd,

Look at message 342 for info regarding guying. An easy guy anchor is to use those screw-in anchors typically used to hold mobile homes in place (and the really big ones are used for power pole anchors). Here, you can find them at ACE Hardware. They come in different sizes.

You might want to get the antenna higher than 30' if possible. Perhaps 38-40'.

I use about a 2-1/2' pipe between the rotor and base of the Hex-Beam. Be sure to drill a hole in the pipe to bolt the HB base to the pipe.

You might want to read the archive regarding RF chokes (baluns) for the HB.

445. Hex-Beam Works Best Aimed at the DX

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-02-28 13:22:34 UTC
From: w4wb
Topic: 445 Message: 445

Recently, I noticed that I was NOT getting those typical "big signal" reports from DX stations. I was even having trouble busting pile ups. When I heard H7DX on and had the beam towards Africa, I figured I would head the beam south to work the H7 prefix. His signal dropped from about S-8 to about S-4/5. Huh? So I headed the beam north and went outside to check the heading. It had shifted to east! Best we can figure is that the short mast from the Hex-Beam base to the Channel Master rotor slipped. The mast is bolted to the HB base, but is just clamped in the clam shell of the rotor. That will be pinned as soon as the weather warms a bit (in the teens now).

Now that I know which way the HB is actually pointing, my "big signal" reports have returned, pile up busting is back to normal (CE0Y, A7, etc. on single call), etc. Whew!

Message is to not trust this rotor to hold the mast in its mount.

73 de Barry - W4WB

Dear fellow HB owners:

I wish to report a serious infringement of the HB Owner's Code of Behavior. This sad event occurred yesterday, but I was too upset to report it until today.

In brief, one of us (VE1OZ) was enjoying DX contacts with Europe and bragging about his antenna (i.e., a Hex Beam). He was so involved in this process that he repeatedly refused to respond to a call from me! My HB was pointed in his direction, the amp was on, and I was using my new Heil HMM mike. Nevertheless...VE1OX demonstrated a complete failure to acknowledge calls from another HB owner.

I trust that Commander Barry will immediately bring this matter before the HB Board of Justice.

With best wishes for a successful conclusion to this problem.

73s,

Herb K6HJM

447. Help Needed

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-02 17:13:36 UTC
From: Joe Caluda
Topic: 447 Message: 447

Hello,
I am trying to homebrew a Hex Beam for my attic.
I am looking for exact measurements an an owners manual for a commercial one if possible.
Does anyone know of any hams that are using them in attics?
I would like to find out how successful these antennas are at relatively low heights and in the attic.
Any help is greatly appreciated.
Thanks
Joe AA5HP

Joe,

My HX-5Bi is at 30' on a small tower. K6HJM has his Hex a little lower and near his roof. Given this, I would say that the Hex advantage at heights lower than conventional Yagis is recognized.

The basic formulas for the Hex can be found in Mike Traffie's original article published in Communications Quarterly. W4WB has scanned in a copy on this site. Go to FILES, PUBLICATIONS and then open the top item.

A number of hams posting on this site have homebrewed Hexs for various bands. I suspect that David, VK2DPD, has the most info on the 5-band versions. You might drop him an E-mail.

From: Joe Caluda
Topic: 450 Message: 450

I am trying to understand the tip spacing as shown in the article by Traffie.
What do the two different tip-spacing measurements on the right side mean? What is the dot between(not connected to any end of a wire) the ends of the driven element and the reflector mean?
If this is a ridiculous question I apologize but none the less I need clarification.
Thanks to anyone who can help.
Thanks
Joe AA5HP

Joe,

Don't worry about the overall tip spacing, the other is simply the length of string you will need to connect the end of the element to centre supporting arm.

Good luck and you must of posted this mail at the same time I send my last e-mail to you.

452. 40M performance

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-03 11:17:35 UTC
From: David Douglass
Topic: 452 Message: 452

Hi All,

I've just put up a 40M vertical (Homebrew of course), and have compared performance with the Hex-Beam!! As would be expected the vertical pretty much wipes the floor with the Hex, therefore putting a damper on my previous comments on out of band performance.

On a more positive note, the Hex is still performing very well on 30M and the in band performance is still well above expectation with yet another new country worked this week (9 so far in 2002).

had a listen out on12M for the net this morning but no propagation into sunny Sydney

Regards all,

VK2DPD, David

Hi David,

Interesting data point. Nevertheless, your earlier observations on out-of-band operation of the HB (using it on 40 and 30 m) did prompt several of us to give it a go as well. I am certain that the performance on 40 m is poorer than a good dipole at proper height or a vertical; however, I have worked a number of stations in Europe with it (100 W CW, 40 m) and Shin told me that he has worked a number in the US (but not the East Coast). Best thing it has going is having some F/B and F/S to reduce the heavy local (US) QRM. Having nothing else for 40 m at the office QTH means that the HB-5B on 30 and 40 m is better than nothing. Still dreaming of a 40 m Hex at my QTH! :-)

454. Driven/Director combo?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-03 16:46:17 UTC
From: Joe Caluda
Topic: 454 Message: 454

All of the literature that I have read says that in a 2 elements yagi beam installation, the director gives better forward gain over a reflector.
Has anyone tried the driven/director combo versus the driven/reflector combo?
Does the hex beam not follow this rule for the 2-element yagi?
Look forward to the replies.
Joe AA5HP

455. Re: Driven/Director combo?

From: w4wb
Topic: 454 Message: 455

Hi Joe,

Well, that is what some folks think. The answer depends upon what your design requirements are to a large degree. Forward gain is only one parameter in the overall optimization of an antenna. Bandwidth, F/B, etc. are also important to most hams. I know one fellow that believes F/B is most important for his QTH while another wants only gain (F/B is of no importance to him). When you balance out all the factors, it seems most 2-element designs use the driven element and reflector ocnfiguration. See the designs in the ARRL Antenna Book (30 & 40 m Yagis and quad). Traffie, I understand, experiemented with both configurations and found the drive-reflector combination to be the best as well.

Hi Barry,

Yep, would agree, anything is better than nothing. I suppose one of the reasons I didn't work so much DX on 40 was that there are probably a lot less stations within a 5000Km, or so, radius from here than you guys. I was listening to the ARRL test last night on 40, and there were some stations that were s9 on the vertical, that were unreadable on the Hex.

Anyway, just to get something for 80 now.

458. Tip Spacing Question

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-04 00:54:27 UTC
From: Joe Caluda
Topic: 458 Message: 458

I need some clarification about the drawing in Traffie's article.
The tip spacing is confusing to me. First of all, in actual
construction, do the tips of the driven and reflector hit the spreader
at the same point or is the reflector end further out down the spreader.

Secondly if the tips although not connected meet at the same point of
the spreader, then the reflector would have to have longer legs than the
9'3" taht the drawing shows.
The drawing says "All Sides 9'3", but if you make the reflector 4%
longer, than the legs would be longer than the driven legs which are
9'3".
I appreciate any and all help with my confusion as possible.
I guess not having the ability to see one in person assembled is
clouding my understanding of the drawing.
Thanks in advance.
Joe AA5HP

459. Re: [hex-beam] Tip Spacing Question

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-04 01:47:31 UTC
From: Brad Sumner
Topic: 458 Message: 459

Joe---let me take a try at your question. If you think about the angle of the wires (or in some cases insulating line) as they leave the spreaders you'll see that they form a sixty degree angle. Two opposite spreaders terminate the ends of the driven and reflector elements. Since the reflector is longer it ends up a bit closer to the spreader than the driven element and therefore has a bit shorter piece of insulating line from the end of the wire to the spreader. All 8 wire sides are 9' 3" but four of them include a piece of insulator. Hence the two formulae to calculate the length of these short insulating pieces. The third formula, if I remember from noodling with the math when I was working on my 6 meter antenna becomes the actual distance directly between the ends of the wires. I worked throught the geometry and found the formulae to work out pretty close but resorted to the trim and check method when actually tuning the antenna.

Hope that helps and even more hope that it is correct.

Good Luck Brad K0TRL

A 40m vertical will have low angle radiation, whereas a horizontal dipole for 40 at 1/4 wave height will have only high angle radiation.

Since 40m can have both NVIS and DX propagation, both types of antennas are needed. Your vertical worked well for long haul DX, but it probably would lose to the Hexbeam on short hop.

Joe,

You need lengths round about the 11foot mark, so reason PVC wouldn't work. However, it was has to be a reasonably large diameter tube to stop it flopping around. That was the first mistake I made with my wood version.

And, yes the wires hold the whole shape together, do you will need reasonably strong wire also.

470. New to the Hex

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-06 22:29:19 UTC
From: George Shaw
Topic: 460 Message: 470

Folks

I have read the articles, the Web site and all you comments in this group. Let me introduce my self and my position.

I have just about to get my licence after being SWL for 20 years. I am interested in HF, Data and VHF/UHF working. The problem (or challenge) is that of my location. I live on the 12th floor of a 14-floor block of flats. There is no balcony at all. I have obtained outline permission from the landlords to allow the placement of an antenna on the roof of the block (height from ground approximately 168ft). The roof is flat and covered in a rubber membrane over reinforced concrete. The area is subject to high winds and strong gusts are common. (It is Ireland after all :)

Now I have been looking for a small antenna that covers as many bands with good bandwidth as possible and | hope I have found it.

Question: How high should I place the Hex above the roof level? Will it withstand the weather conditions? What bands will it REALLY work on (multi beam)? Any users in UK? Can I mount a 6m/2m/70cm vertical above the Hex multi beam?

What is the real opinion on the Hex, without any sales talk? Is it snake oil? (I don't think so my self after reading all the reports).

I hope to purchase in a few weeks.

--- In hex-beam@y..., "George Shaw" <george.shaw@u...> wrote:

> Question: How high should I place the Hex above the roof level?

Depends on how big the roof is. If the roof is small compared to the wavelength, any height will be fine. If the roof is very large, then you need to get it up at least 30 feet. If the roof is somewhere in between, then you can put it up at some height in between. I recommend putting it at the height that is most feasible given your available mounting options -- survivability is more important than gain.

> Will it withstand the weather conditions?

The beam will. Focus on the mounting.

> What bands will it REALLY work on (multi beam)?

Great performance on 10 through 20. 6 and 30 may be bonuses (works on mine).

> Can I mount a 6m/2m/70cm vertical above the Hex multi beam?

Not likely. The center post is not a mast. Just mount the vertical on the roof. At 168 feet up, you don't need a tower for a VHF vertical -- you don't even need gain.

> What is the real opinion on the Hex, without any sales talk? Is it snake oil?

It's a very nice 5 band 2 element beam. It will be a few db down from 3 element monoband yagis and 2 element quads. It will be very close in performance to "trapped" multiband 3 element yagi, as the loss in the traps approximately cancels out the gain of the extra element.

Compared to other 5 band beams, it's the clear winner.

Hi George,

Let me first answer that this is an independent Hex-Beam user group that has no connection with Traffie Technology. In fact, Traffie doesn't use email and makes no posts on this site. What you read here is likely just what folks think about the antenna.

GL on getting your ham license. I'm sure you will have even more fun.

You really need to take the apartment landlords out for a pint or two! Having the antenna at such a height can be problematic (low TOA). Primary issue is what is in the roof and its relative RF size. Will it serve as a ground plane or not? At 168' about ground, the Hex-Beam would show 5 well-defined lobes with the main lobe being at 6 degs (deep nulls in between lobes). See my earlier posts about TOAs and height of the HB. The question is what is your effective height? Performance will be in between the extremes I would think. In any case, it will serve you well.

Look at the JR1NHD installation on the home page. I think that is on top of a 6 story building. Try to get your HB up 20-25 feet above the roof if possible. A good trick is to use a 36-40' telescoping mast and set the sections to overlap. Drill and bolt them in place. I would use three guys (one just below the rotor). Use a proper guy material. I have no idea what is available there, but you don't want to do it twice now do you? I would stay away from metal guys unless you understand how to mechanically and electrically use them correctly.

Good luck. Hope to work you soon!

George,
Welcome to Amateur Radio!

First off, I do not own a Hex Beam yet, but I am strongly considering one.

I want to mention something about the 6m/2m/70cm antenna or antennas you are considering using. The experience in our part of the world is that at a typical Ham's house a multi-band Comet, Diamond or the like works fine roof mounted up 10 meters or so. When these types of antennas are mounted higher where they catch more wind, they don't last long. If you can put up commercial two-way types of antennas you will be better off. An alternative is simple single dipoles or small ground plane antennas for each band. Something small that can withstand the wind better. The issue is not so much high winds breaking the antennas, it's the fatigue from constantly swaying and flexing in the wind.

73,

Charles WA5VHU

Subject: [hex-beam] New to the Hex

Folks

I have read the articles, the Web site and all you comments in this group. Let me introduce my self and my position.

I have just about to get my licence after being SWL for 20 years. I am interested in HF, Data and VHF/UHF working. The problem (or challenge) is that of my location. I live on the 12th floor of a 14-floor block of flats. There is no balcony at all. I have obtained outline permission from the landlords to allow the placement of an antenna on the roof of the block (height from ground approximately 168ft). The roof is flat and covered in a rubber membrane over reinforced concrete. The area is subject to high winds and strong gusts are common. (It is Ireland after all :)

Now I have been looking for a small antenna that covers as many bands with good bandwidth as possible and | hope I have found it.

Question: How high should I place the Hex above the roof level? Will it withstand the weather conditions? What bands will it REALLY work on (multi beam)? Any users in UK? Can I mount a 6m/2m/70cm vertical above the Hex multi beam?

What is the real opinion on the Hex, without any sales talk? Is it snake oil? (I don't think so my self after reading all the reports).

I hope to purchase in a few weeks.

When it comes to vhf simple vertical antennas, none beats the
mechanical durability of the copper water pipe J pole. They last and
last and..... I gave up on aluminum vhf some time ago.

Ok points taken on board. Unfortunately the Landlord is an organisation so it would end up as several nights out on the beer to succeed this way :) but it would be fun trying.

As I wish to minimise the visual impact during daylight hours, would it be possible to arrange a height adjustable tower/mast? I would need to control this from my apartment but it would make an optimum set-up. If not I will have to arrange to fix at a height so that from ground level and viewing angle the antenna is mostly below the building edge, about 10-15ft

FB George. One way to lower the visual impact is to paint the antenna flat black (non-conductive paint) and the mast/tower. Even with a bright sky background, it will be very hard to see, and at that height, even more so. The arms are at most 3/4" diameter. Given that you must stand away from the building a modest amout to see the antenna, say a total viewing distance of about 200', the angular subtense of the arm will be about 0.3 milliradian. This happens to be about the normal visual acuity of the human eye. The reason for flat black rather than a blue or camo or whatever, is simply that they all reflect light. The idea is to not reflect light. After several years, I still have to do a double-take when I check to see if my flat-black Titan antenna is still out in the yard! I note that the eye can detect a black line against a very bright field that subtends just a second of arc IF the observer is not distracted and knows what he is doing (rare). Basically, it will just vanish as far as folks on the ground are concerned I should expect.

Hello to All:

As a second (?) choice for color, try grey auto primer. This stuff is very, very flat, comes in a spray can (Rustolem makes one type), and is very forgiving of sloppy spray techniques.

Believe it or not, my wife has told me TWICE that the HB looks "nice" and much, much better than the prior minibeam. By the way, she is not a ham and is very sensitive to the looks of our house and the neighbor's opinions.

I vote also for the flat grey color.(Webster dictionary gives you a choice of gray or grey) I have been involved in commercial installations for 35 years, and gray is the most acceptable color. The black casts a hard silhouette against the sky, while the gray tends to blend in easier.

The largest mistake I ever saw was a broadcast antenna painted white; you could see it sticking out like a sore thumb for two miles. The neighbors were up in arms in a matter of hours. We had warned the installer, but were ignored. It ended up with the local councilman and county supervisor making threats, so down it came and it had a new paint job with gray.

My guess is that Traffie has no choice in colors for the spreaders, and they are actually made for other uses, then modified for the Hex. Let's face it, the ham market is not the biggest, so a lot of these companies are at the mercy of the manufacturers, and what is available for other uses.

Hi Hal,
I still go with flat black from my experience for his installation, but either will beat the standard white. If you have a high tower, then a gray is preferred because it reflects the sky surrounding and fades better; however, a low tower will be closer to artificial light sources and the reflection from the gray often stands out.

FWIW, the arms are custom made for Traffie.

Dear All:

For the right price, the K6HJM Painting Services LLC truck will come to your location and paint your H-B antenna. At present, colors are limited to two: grey or gray.

All work is private, confidential and guaranteed.

73s,

Herb

482. painting (Was:: New to the Hex)

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-09 07:04:37 UTC
From: George Shaw
Topic: 460 Message: 482

Not wanting to take this to far off topic, the advise given so far on painting the beam is great. Would it not be a better position to adopt the military and nature approach of camouflage say using a mix of grey, light blue all matt finish as that would break the profile to an even greater extent.

I did a small experiment last night. I took 4 10ft long poles around 2" in diameter (PVC water pipe) and painted on matt black, one light blue, one white and one camo (greys light to dark, blues mixed) and placed them on the roof of the building I am hoping to install on. From ground level the white one stood out like a sore thumb. The black one noticeable during afternoon through to early evening. The grey one fairly invisible. The camo one dang near totally invisible. Wx was overcast (it is Ireland after all) sky grey, light rain at times.

Hi Hal,
I still go with flat black from my experience for his installation, but either will beat the standard white. If you have a high tower, then a gray is preferred because it reflects the sky surrounding and fades better; however, a low tower will be closer to artificial light sources and the reflection from the gray often stands out.

FWIW, the arms are custom made for Traffie.

Date: 2002-03-10 05:33:23 UTC
From: w4wb
Topic: 484 Message: 484

Dear Member,

Please see the Files area to view a copy of the article by Shin - JR1NHD on the HX-5Bi, which appeared in the March 2002 issue of the Japanese DX Magazine "Five Nine." Once you sign onto the hex-beam Group site, go to Files --> Publications --> The HEX-BEAM HX-5Bi.

This was a cover story article. Congratulations to Shin and our thanks to him for providing a translation from the Japanese into English.

His HEX-BEAM is on top of a 6-story building.

485. Shin's article

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-10 12:43:24 UTC
From: buzzmann555
Topic: 485 Message: 485

Just finished reading the article Shin wrote for 59 Magazine. Excellent job! I enjoyed the article and the photos. Another fine bit of advertising for Traffie Technologies. Mike better crank up the production line. Ought to be getting a bunch of sales in Japan due to the article.

486. Hexbeam 201 up; results and operating observations

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-10 13:08:52 UTC
From: wo8usa
Topic: 486 Message: 486

This is mainly for people considering a Hexbeam but may be of interest to others too:

Hexbeam #201 went up here in Dayton, Ohio on a cold snowy day, wind chills about 0 degrees with flurries. Although I am not a "contester" I wanted it up in time for the March DX SSB contests. I spent a considerable amount of time researching antennas before deciding pn the HX5Bi.

The service from Traffie and follow-up are excellent. Do not worry if you have a problem, they will take care of it including their gurantee of "if you don't like it return it as it was sent for a refund".

The mount here consists of a Rohn 30' push up mast. I find its quality excellent. Beside the Rohn mast I have a 12', 4x4 wooden pole that provides a lot of support. The mast is secured to the post with heavy duty post clamps from Lowe's. I use non-metallic high stength guy wores from Radio Works to guy it at the higher levels. The post itself provides great support so the antenna could stay up at 10-15 feet without guying for testing. The 4x4 sites in a hole filled with concrete, the mast is mounted using the Rohn mount bolted into the concrete.

I also use a Radio Shack TV rotor. I would have preferred the older Channel Master but did not want the IR remote. I have seen both rotors and they look almost the same.

Construction of the Hexbeam was greatly aided by the excellent documentation by Floyd, W8AC. The biggest improvements to the instruction manual would be just adding Floyd's website to the instructions! With both sources the went togethter quickly and easily. One bad thing, my hexbeam hub assembly was not provided with the proper mounting hub so I had to improvise by drilling by own hub-to-mast bolt locking hole. I am sure I could have called Traffie but I was at a point where I could not stop and had to get done. All the preassembly done in the plant makes the beam much easier to build than any other "less complex" antenna. I cannot imagine putting all the clamps on in the right spot.

Getting the Hexbeam up on the mast could use some suggestions or recommendations. This was the hardest part; due to the symmetry of the antenna there is no real good place to raise first.

I used the Hexbeam in the ARRL DX Contest and plan to do the same in the CQ contest coming up. I made comparisons in signal level (yes, I know S-meters are so inexact but, at the same time with the same

station on the same frequency provide a general scale for comparison).

Operating: I made about 100 "observations" in and out of the contest on all bands 10-20m. My rig is an Icom IC706MKiiG, 100w NO amplifier. I did not use any signals which where extrememly strong >s9. These consisted of a direct comparison with my Cuschraft R6000 (6-20m) vertical AND turnig the hexbeam to determine its pattern response. Transmit reports/observations seemed to be the same as my receive observations:
1) For about 20 percent of the observations, each antenna clearly had an advantage. Example: 10 percent of the time the signal was at least 3 S-units weaker on the Heaxbeam the the R6000, and the other 10% was the opposite. I atribute this to polarization of the path and the angle of arrival.
2) In about 30 percent of the cases, small differences of less than 1 S-unit were noted, either way (R6000 or Hexbeam).
3) In about 50 percent of the cases, the Hexbeam had a 1-3 S unit advantage.
4) I think the pattern data generated from the EZNEC model is relatively accurate although I do not observe the deep nulls and high front-to-back others have reported. Main lobe is so wide it allows me to NOT turn the antenna unnecessarily. Finland, UK, France, Spain, and the Canaries are all at about the same dB level so why burn up rotar life? Reorientation tests looking at the differences (again S meter differences) seem to confirm this wide main lobe.

My only operating problem is high SWR on 15 and 17 m, I have to use my tuner on these bands. Otherwise SWR is great on all other bands.

If you are looking for 3 or 4 element monoband performance on everyband you will not get it with this system. You will get an excellent balance of size vs performance and ease of construction. You will get an antenna which can stand up to harsh climates. The quality of the antenna material is fabulous and I have every expectation that the antenna will last a long time. No big tower, no hughe guy wires no huge rotar make it great for improving a station in a small footprint.

Last note--I would suggest more research into Hexbeam's pattern and performance from a academic viewpoint. It should be relatively easy to get some academic interest in this from the standpoint of "electrical engineering departments always need good research projects for masters and Ph.D students." Some of these might me able to make range measurements and document the Hexbeam from a theoretical perspective, describing the antenna based upon Maxwell's equations and determing performance based upon calibrated measurements". The only problem would be arranging the department to purchase one of these antennas. If we could convince the school to buy one for a project with the vision of it becoming the antenna for their school's club station then some of the unknowns in Hexbeam technology might become documented. Maybe the group could do some

brainstroming on this topic.

Hi Chris,

Thanks for a FB report on #201. Your comments about higher SWR on 15 and 17 m strikes me as odd considering all of us (even Herb) don't suffer this problem. Look at the posted SWR values by WB6ROH, JR1NHD, and W4WB. As I recall, WB6ROH has his HB at about the same height as you do. On 20 m, the primary effects (relative to having it at 38-40') are a little gain reduction, deeper null at 180 degrees, and, most importantly, a higher TOA of 5+ degrees. Although the HB works nicely at 30ish feet, a lower TOA realized by getting it up a bit more can help your DXing I bet. WB6ROH also uses a hortical antenna. There have been a few times he was stronger on the hortical than the HB when we talked on 10 m. As you said Chris, propagation and polarization play a significant role.

Perhaps you should discuss the SWR issue with Traffie. Are you sure you are seeing a real problem or a measurement problem. For example, have you shunted any currents flowing on the exterior of the coax shield? Have you tried adding a coax jumper of say 10' to see if that changes the SWR?

GL in the CQ DX Contest!

From: w4wb
Topic: 488 Message: 489

Hi Joe,

I just tried it and it worked FB. If I left-click on the link, then Adobe Acrobat opens up. It takes a bit of time for the document to show up since the file is over 2 MB. If I right-click and select Save Target As..., then the file is downloaded into a target directory to be opened later with Acrobat. With my Internet connection, it took about 40 seconds after Yahoo! decided to link me in. :-)

If you continue to have problems, email me and I will send it directly to you.

490. Traffie Fiberglass type?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-10 21:40:16 UTC
From: genesisjoe2001
Topic: 490 Message: 490

I have just fabricated my center hub and need some info on the type of spreaders that Traffie uses or that a hex user can recommend.
Should I use solid fiberglass rods like those sold by Max Gain Antenna systems or should I use hollow/tapering poles like those used for quad spreaders?
The rods come in 8-foot lengths and the 1/2" diameter runs about $6.00 each.
The quad spreaders are two piece9 8 foot each) that when put together telescope to 15 feet.
I am homebrewing a 5-band model and can use a 1.5' wooden dowel as the first part extruding from the center hub thus giving me the 9 1/2 feet needed for 20 meters.
Thanks for any and all input.

Dear H-B Friends (and Barry):

I have just received the March 10, 2002 email from Barry (W4WB) to Chris regarding the high SWR noted by Chris.. Most of the content is clear, but I do have a problem with one area: the second sentence contains the words "...considering all of us (even Herb)...".

What does this mean? Am I not part of the HB Group? Just because my HB antenna is 25 feet below ground level does this make me less of a person. So what if most of my QSOs are with worms and moles? They have feelings!

I am still upset that no one has responded to my March 8 email regarding the K6HJM Painting Service LLC...we do antennas right! But to now be singled out merely because I have the first underground HB system...this is too much.

I trust that there will be a prompt and appropriate response from W4WB!

Herb,

Low SWR doesn't mean Subterranean Wireless Radio. ;-) Leave the poor worms alone; however, moles are a different matter.

Actually for those that don't know about Herb's installation and his SWR saga, you might want to read some of the earlier posts. His HX-5Bi is about 7' above his 2nd-story flat-roof (and his lucky to have it that high from what he has said). The antenna's SWR was oddly high. Of course, having it close to the roof detuned it a bit. Long story short, WB6ROH and I helped Herb to sort out the problem over a period of a week or so. His SWR returned to acceptable values on all bands and he started Hexing some good DX.

My point to Chris WO8USA was that his high SWR on 15 and 17 m with the HX-5Bi at 30ish feet just shouldn't be considered normal. Herb's Draconian mounting treatment of his Hex-Beam was simply an example of the fact that the SWR should be acceptable in Chris's case. Alan K2ACB also has a low roof-mounted HB except he has a peaked roof-line and his SWR is OK. WB6ROH also has his HB lower than recommended by Traffie. Doug got a 33 from a Nepal station the other day. Perhaps it would have been 44 or so if he had the HB a bit higher, but as Doug said, "I'll take 33 any day and have it in the log!" (or something like that).

I'm not even going to touch that painting offer of yours Herb.

Joe,

Since mine is made of wood, I cannot speak with any real authority, but I would go for the hollow tubes. I tend to think this would be more rigid and a little less springy??

I wish I had your dilemma, as I can't get the bloody stuff out here at all.

494. Should I buy it....

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-11 15:13:36 UTC
From: Nick J Chiarchiaro, CET
Topic: 494 Message: 494

Hi Everyone,

I thought I would pose this question here:

1) I like to work 6m SSB, instead of the Cushcraft A503S which would you choose?

2) I am also looking for a beam to replace my Cuschcraft World Ranger Rotatable Dipole on 40-10. I am looking to get beam performance on 20-15-10M and was thinking of the Cushcraft A3S(??model #??)

So I am willing to string a wire dipole up in my trees for 80-40 but I want real beam performance on 6, 10, 15 and 20M.

My QTH location is about 735' (as per the GPS) and the antenna will be mounted about 40' above ground on my roof...I am on a 1acre lot and I do not need to worry about turnng radius..heck the worlranger dipole was 35" long....

All antenna points are Radio Shack rotators with re-enforced eve mounts...basically through bolted with 2x6 supports behind and anchored as well.

The World RAnger DIpole has been up in the Northwest NJ WX for the past 6 years with no problems at all....in structure or performance for what it was designed for..

So with that said I am basically looking for some beam performance without going throught the expense of putting up a small tower to support a larger array.

Do you think the HEXBeam is a good choice?

How do you feel about the Pac version as I would like to use it prtable when i am in vermont on 20/10 & 6m QRP....

thanks for any info....

NIck

From: wo8usa
Topic: 497 Message: 497

All,

I posted a message about my install and operations here in Dayton but realized it was never seen by anyone! I will try to restate it here:

I got my HX5Bi up before the ARRL SSB DX Contest. I have kept track of my operations. No, the comparisons are not apples-apples. I compared the Hexbeam to the Cushcraft R600 Vertical.
--I noted about 10% of the time the Hexbeam was a clearwiner, albeit by the inexact >3 S units. I owe this to polarization differences.
--10% of the time the Cushcraft R600 was the clear winner. I owe this to polarization differences.
--30% of th time there was 1 S unit or less of difference
--50% of the time Hexbeam was 1-2 S units stronger.

I have not noticed the high F/B ratio. But I believe in general the pattern in EZNEC is relatively correct. The antenna will not deliver 5 band monoband performance and is not a miracle antenna. But as far as performance vs size and ease of operation and required infrastructure, it is a definite winner.

W8AC's website should be added to the instruction manual. Its a must. With both in hand the antenna construction time took about 90 minutes. Having the antenna preassembled is a great plus for the antenna.

More instructions need to be given on "just how do I get this thing up in the air".

A lightweight rotar is all that's needed. I got mine at Radioshack, $70.00.

I use a Rohn 30 foot push up mast mounted to a 12 foot 4x4 post, with guying at the upper most levels. The 4x4 gives a lot of support especially during initial mounting. Its 3' in the ground too to help with support. I got my guys from Radioworks, non-metalic heavy duty stealth rope.

I cannot say enough about Traffie and his guarantee of "If you don't like it just send it back in original condition". I do have SWR problems on 17 and 15 m so must use my tuner. Also, the wrong bottom assembly on my hub mount was attached so I had to drill my own holes. I am sure they would have shipped me a new one but I was not in a situation to wait.

I have a A3S in my neighborhood--no comparison in size or visibility. Paint it all flat grey and its hardly noticable.

I plan to put a positive review, similar to this, on E-ham. I would but the antenna again.

Hope this helps anyone thinking about the antenna, sorry the original, elegant description of my zero degree day in Dayton.

Hi Nick,

You might like to read the prior messages to find answers and to look at the files, photos, and bookmarks.

Sounds like you might could do well with a HX-5Bi (5-band --- 10-20 m) and the 6 m HB. However, if you have the room, put up a bigger 6 m Yagi rather than the HB. Use wire antennas for 40 and 80 m.

The HEX-PAC works fine (30' height). For what I have heard, it takes about 15 minutes to change from one band to another.

Hi,

I also wish to have 6m beam below HX-5Bi but am concerned if Hex may be affected due to close distance between two antennas. Did anyone experience Xmas tree and see any bad affect on SWR for Hex?

BTW, thank you for reading my article, especially thanks to Barry to make a pdf file and post it.

Gents

Where are plans available for the Hex, particularly details of the feeder etc. I have been asked by others as I will probably buy mine.

From: Joe C
Topic: 502 Message: 502

Can a Hex Owner tell me the spacing on the center post between the 5 feedpoint locations on the 5-Band HX5 model.
I approximate that the distance bewteen the 20 and 17 meter attatchment points is about 8 inches .
Hoe off am I?
Thanks for the help.
Joe AA5HP

Joe this all depends on how "bendy" your spreader arms are, but my homebrew one had a spacing if about 18-19 inches.

For those that want the dimensions of the commercial HexBeam, I believe that it will be most difficult to "clone" a copy of it.

You must understand that the center post of the Hex has a "twin feed" type of Open Line bus going down the inside of the vertical PVC pipe, and it feeds the various driven elements for the bands. There are many factors involved with this kind of feed. The type of wire, the guage, distance between bands, and the type of insulation on the wire will all figure in on determining the impedance of the line. The impedance of this line is critical to matching the driven elements, as the driven elements are cut to give matching for a low SWR with this exact twin feed system.

As each driven element and reflector was trimmed and cut for matching, all the other driven elements would vary from their previous cut&match. So Traffie had their hands full in doing this "chasing-the-tail" tune up. Once it was completed, the matching twin lead in the feed system had to made exactly the same for all future Hexbeams to preserve repeatable SWR matching and performance.

Now the catch. I am not going to disassemble the center matching system to see what makes the feed lines, and I don't know anyone that would. It would ruin the system to do so. I guess that what this means is that if you want to make a homebrew Hex beam, then you are on your own. I am glad I bought mine before the price went up.

Topic: 502 Message: 505

Which is pretty much why I will be individually feeding all the elements on my next version, although I like to think I have pretty much shown that good performance can be had with little effort (all be it, not necessarily good SWR).

For homebrewing a multi-feed I would recommend having the feed outside the post for easy adjustment and playing about with it. Although the feed line inside the post may play a role in producing a good SWR, I don't think even major changes in wire type and spacing will effect performance all that much.

And Hal, were has the spirit of adventure gone. I thought it was a pre-requisite of being a Ham, that the first thing you did with new gear was take it apart and find out how it works. I'm sure that's in the licensing requirements in Australia. You guys in the US but all be getting soft!!

Regards All

David

506. Rens' Erection (WB3FSR)

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-15 17:12:23 UTC
From: Peter D. Vouvounas
Topic: 506 Message: 506

First I'd like to say hello to all of the HEX Beam users / potential new users on this list.

I just recently discovered the existence of this list - An yes, I've read ALL 505 messages as of last evening.

I am having so much fun with this antenna. For example, in the ARRL DX phone contest a couple of weeks ago I made 1225 contacts. This antenna ROCKS! Living by the ocean here in New Jersey (The Shore) we get our share of high winds - So far the HEX Beam holds it's own.

My 5B HEX serial # is 136

Below, please find a little write up of the events in raising my HEX Beam "Rens Erection".

Also I've posted 33 pictures of the event: In a separate posting I'll identify the players.

http://photos.yahoo.com/wb3fsr Click here for Pix's

==========
Ren?s HEXED Erection the Day After (WB3FSR)

What a crew - I owe all of you a great big THANKS!!!! Job well done.

A lot of teamwork came into play, not to mention sore arms & legs, sunburn and I'm sure lots of fun.

Wow, how would one put this into words? Most would have a hard time believing this came together as it did.

First we have Frank KF2FI, rode his motorcycle all the way from the Pocono Mountains and arrived just at the right minute as we teetered this mass in the air. Next, we have Sid N3JHV; AKA Stimpy through his persistence used his pickup at just the right angle to support this massive erection. Just another sign of Super Stimpy behind the wheel. Bruce N2NAG, who made us laugh and cry throughout this ordeal as well as keeping Frank in control, well maybe. Charley, the roof admiral who surly saved our butts from electrocution.

Now Dave KD2E needs a section all to himself. He was the wise one taking this all in. Similar to an eagle perched on the rooftop, Dave in many instances handles the business end of this massive mastodon single handedly. Since this was Dave's first association with this motley crew known as the Ren & Stimpy Sea food Group, it will be most interesting to get his thoughts over the next few days.

Throughout the day, we had many people stopping, starring, and asking questions. These included smatterings of weirdo?s like the guy who stopped his car in the middle of a busy intersection for a good five minutes with nothing to say. Yes Sid he qualified as a mumbler!

Now for the all time best event that pulled this all together. Out of no where, at just the right microsecond a family pulls up with their car in front of the operation at hand. Let's paint the picture a bit better - the crew is struggling to hold the assembly horizontally in the air around 20'feet above ground. Ladders are flying; the earth appeared to be rocking giving way any minute to a catastrophe of bent metal, house destruction, the crew harpooned by flying elements. When a little voice just discernable over screaming mussels and anxiety sez we have a crane two blocks away, would you like us to drive it over. Yes Yes Yes. Just when most felt no way would we be able to raise this contraption the answer came.

Boy, did it sparkly in the sunlight; sitting on its new perch this array of fiberglass and aluminum looks like it's reaching towards Mars.

We worked into the late night running cables around the tower/roof, the attic and into the basement. Over the next day or two I should get this labyrinth of anacondas connected - More to follow:

508. Ferrites for Baluns Do we have the facts????

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-15 18:18:52 UTC
From: Peter D. Vouvounas
Topic: 508 Message: 508

Do we have any real world facts on using ferrites attached to the transmission line?

Power Loss?

Heating?

10 Meters - Any loss of RX or TX

How far from the HEX beam can one install them? Now that the antenna farm is up I can only get within five feet of the bottom of the HEX...

Any real world experience one might share i.e. before and after installing ferrites - How many and where?

Running 150 to 1500 watts from my station - I have RFI issues to resolve in my home Entertainment Systems- Stereo's, TV's, VCR's, Cable TV, Computer spkrs.

All phone RFI cured by replacing phones with Panasonic 2.4Ghz Gigarange & Extreme phones!!! Crystal clear at any power level.

Hex Beam mounted 38' AGL to bottom of HEX - using two 3" wide solid copper straps from base of tower on roof to ground rods All equip in shack bonded to common ground - using six rods tied together - Radio works T-4 Line Isolator between Kenwood TS950SD and Emtron DX-2sp Amp and second T-4 on output of Amp.

Ren, nice pics and story about your installation. Answers a few recent question folks had about stacking up antennas.

Re. the ferrites, read W2UN's book (Reflections II). Basically, you are not going to overload the ferrites unless you have a VERY poor system. They only "see" the current flowing on the outside of your coax shield. It is not overly critical how close to the antenna you put them, but try to get as close as possible to keep the line between the ferrites and the connection to the antenna as short as possible while keeping them below the base of the Hex-Beam. I run 1000+ all the time with no problems. Herb does as well (when he is not warming the moles and worms).

I prefer Type 73 material, but #43 works OK. Presently I'm using #43 since I could get it cheap from All Electronics. #43 is really better for VHF, but works OK in the HF bands of 10-20 m. THe Curie temp of #43 is lower than I would generally like, but OK under most conditions. #73 has a much higher Curie temp and HF characteristics.

When we made the latest unit, we used 10 beads. THey were epoxied together, slipped over the coax, and then held in place with a big old section of heat shrink. Don't epoxy the beads together however.

When I was using the air balun, I had to put a second one at the rig to keep 17 and 15 m out of the company's phone system. When I get around to it, I will place a second set of beads near the rig.

Hope that help answer you questions.

Again, nice installation Ren. Might show up on the main page soon. ;-)

Friday is better since Thursday is arrival day and setup for those of us having display booths (W4RT Electronics). I think a lunch time meeting might be fine.

From: robgerard
Topic: 516 Message: 516

A few moments ago, I was doing some work on the computer, took a brief break to look at DX Summit. Saw A92GE (Bahrein) on 12 mtrs, switched on the radio, turned the HX-5 at him, listened to the enormous pile-up, then put him in the log on the first call. Amazing...it happens all the time now, but I don't think I'll ever get used to it. 73 de Bob, K2WY.

PS Count me in for Dayton

517. Why

As the old rock and roll song goes (sort of): Why is Barry always pickin' on me?

Just because I make silly comments like having my HB below ground level (actually only 7 feet above my roof), Barry calls this SWR...Subterranean Wireless Radio.

OK...to be serious. The beads work great and really please the neighbors and the wife...no more "K6HJM" coming out of the living room TV when the set is turned off! Really...it was most strange!

I worked Kuwait last night...I think. Was an American sounding voice, very much 59, easy to get, etc. But it was strange: without any obvious reason, he said "This is too exciting..I am going to bed" and just QRT. Nothing more! Was this real?

Herb -

Was it 9K2ZZ? I worked him at 0043z on 20m SSB, and also thought it was easy, getting a 59 on the first call. The callsign is legit, and he has a US QSL manager.

Interesting thing was that I wasn't using a Hex-Beam, so I can't credit the antenna with the QSO like the rest of you. (I'm one of the lurkers here, and can only dream of the day when I will have a decent antenna.) My 20m antenna is a dipole in the attic. And the radio is a Yaesu FT-817, five watts out.

So I, too, am hoping this was real. We'll see--I mailed my QSL request this morning.

Hi Guys,

I would think your Hex-Beams are getting a good try out in the pile-ups for VP6DI?? Don't think I've ever seen such a mess on the band, although I suppose he is an all time new one. Good luck and hope you all make it!

David:

The HB helps, but the pile up is amazing. Further, some of the callers have forgotten what they learned (?) when they got their first licence. Some 4-letter words, failure to understand split mode, etc, etc. Like kids fighting over a toy!!

Anyhow, I have yet to work VP6DI, but will do soon I hope...he is very loud in Los Angeles. However, I did work XR0X (or was it XR0R?) so the HB does well in a reasonable size pile up.

Date: 2002-03-18 20:30:44 UTC
From: w4wb
Topic: 523 Message: 523

OK Guys, I can brag too. ;-) I got the XR0X on 12 m SSB on the first call the first night, although it took 9-10 tries on 12 m CW to get him. Now have him on other bands too.

The VP6DI piles are mess! 40 kHz wide at times! Took me about 5 minutes to work him on each 10 and 15 m SSB this morning. One call on 10 m and two calls on 15 m. I spent my time trying to hear where he was listening. Simple to do a polite, but tight tailgate and reap success.

Hex-Beam is doing its stuff (of course the Quadra and QRP-honed operating skills).

GL on working these two DXpeditions on all five bands!

Hi all,

Well, Hex Beam serial number 4 bit the dust a month or so ago; the result of heavy winds and insufficient guying.

The new Hex Beam has been assembled and is awaiting raising to about 75 feet (hopefully) this weekend. (And the guying mistakes shall not be repeated.)

The antenna is now at 10 feet above the ground. As I told Mike earlier this afternoon XR0X and VP6DI went in the log with the antenna at 10 feet.

We spoke at some length about the relative benefits of various heights. I will post the results of the antenna at 75 feet. As stated above, the results at 10 feet have not been too shabby.

Best wishes and good luck.

73,

Tony, AD1Y

From: w4wb
Topic: 522 Message: 528

Hi Herb,

Best cure for those problems is to work that DX guy quick and move on. Let the others stay and yell into the ether! :-)

It was XR0X you worked (#36 most needed). See http://cordell.vwh.net/SFX/ for more infor and some interesting info about the DXpedition. The site for VP6DI (#1 for now) is http://www.qsl.net/aa0mz/ducie.htm. Next big one is VK9ML Mellish Reef (#37) http://www.qsl.net/vk9ml/2002/ in about 24 more days. This place doesn't look like many folks vacation there.

Keep on Hexing the DX Herb!

Good going all on the DX with the HEX. I've heard the Europeans taking a lot of flack in the past for causing QRM, but with VP6DI I've heard a fair proportion of idiots from all over the World (VK & ZL included). Fortunately they are both in the Log here, so I can turn off, put the Footy on TV and drink some beer.

On March 17 at 2351 UTC I worked XR0X at 24.945...59 both ways!
On March 19 at 0442 UTC I worked VP6DI at 28.495...59 both ways!

Based on the above, I believe my HB is mounted too high, thus giving me an unfair advantage versus those with lesser antennas. To get a 59 on 10 meters late at night is unusual for me. I therefore plan to lower the antenna to ground level, or perhaps to slightly below ground level. As Barry The Elder points out: SWR=Subterranean Wireless Radio.

73s, Herb K6HJM

PS: I really did ask the VP6DI if I was a "real" 59 or was it just a nice way of confirming the contact...he said that it was real! So there Barry!!!

From: k5ppdx
Topic: 520 Message: 532

Worked 'em on 40 this morning. I used the Hex for receive since the Butternut was too noisy. I also worked XROX on 75 using the same procedure. Although the DX signal was a tad weaker, the noise floor was so much lower that it was the only way to hear through the hash and CB'ers. I am going to hook my antenna switch back in the line to use the MP's A/B antenna selector to set Hex automatically on receive in these situations. 73, Max K5PP

Are you having an attack of paronomasia Brad? Perhaps there really is a radiation angel packed with each Hex-Beam --- works for me! ;-)

Herb would be the best to try the upside-down Hex-Beam since he could then cover and raise it higher above the roof than ever while claiming to his neighbors (and XYL) that it is a large umbrella for his roof top patio. He could then check out the lower radiation angle theory while being watched over by the radiation angel (proximate to Los Angeles). :-)

Topic: 542 Message: 542

I am very impressed! First of all, Barry The Elder is skilled at using obscure English/Greek words! In his most recent email to us unwashed and illiterate bums, he used the word "paronomasia". Of course this word comes from the Greek "paronomazein", which means "to call with a slight change of name". Those of us with a HB antenna might use a simpler definition and employ the term "pun". Others who do not benefit from owning a HB might merely say "a piss-poor attempt at humor". So, take your pick!

Secondly, I wish to indicate my agreement with Brad and David regarding the use of the HB with a 180 degree rotation so as to place the base of the antenna further from the supporting structure. I fully understand the need for this rotation in VK Land, and also agree with Barry The Elder that it could result in a useful structure for roof/house protection. I have already carried out preliminary tests, and have determined that covering the inverted HB with 0.005" gold-plated mylar sheeting has a major effect on both roof protection and signal propagation.

In overview, I remain in awe of "The Elder". He knows many things and has many ideas that are unknown to mere humans. Perhaps a parallel universe? Magnetic flux tube system? Propagation off the side of his vertical?

73s,

Herb K6HJM

From: pb1tt
Topic: 543 Message: 543

hello all,
after moving qth last year, I'm planning to put up a new antenna this Spring. I'm thinking about ordering the dual band hexbeam for 10 and 15 meters. Also, I would like to add wires for 12 and 6 meters to make it a 4-band beam. Any thoughts about this? Is it easy, or a hard job to add bands to an existing hexbeam ? would perhaps Traffie be willing to do this modification ?

Hi Peter,

Best ask Traffie this one direct. From what I understand, it is a non-trivial matter to get the added bands into it correctly. Originally, he had intended to include 6 m, but it didn't work out. Must have caused too must trouble. Trying to get 30 and 40 m to play together is not easy either.

From: Joe Caluda
Topic: 546 Message: 547

Okay here goes again.
It seems as though the original message got messed up.

I am looking for info on what happens to the SWR and feedpoint impedance of a dipole when you go from a standard conventional dipole, to a hex configuration and then to a double hex which looks like two "M's" side by side instead of a single "M" like a coventional hex element. I am not concerned with parasitic elements at the moment.
When you go from a standard dipole to a hex you compress the width or length of an antenna for 10 meters from 9 feet to approximately 6 feet on each side of the feedpoint.
When you go to a double hex and open up the angles a bit you compress the length to only 3.25 feet on a side. Each leg, of which there are now 8 instead of 4 is only 2.25 feet long and the entire length of the driven element is now 6.5 feet instead of 9.
But what will happen to the SWR of this driven element and what will happen to the feedpoint impedance when you change the shape to a double hex. The 8 legs will be a little closer together than the 4 in a conventional hex.
Does anyone out there in this group do computer modeling?
I look forward to the replies and any insight that can be provided.
Thanks
Joe

Hi Barry and All,

I wonder if the difficulties in getting a 40/30 Hex to work were related to the use of a single feed, or whether, the same problems were encountered with separate feed lines?? Along the same lines, I wonder if it would be possible to put 6m elements on the 5 bander, but feed it separately??

I'm in the process of taking down my HBH (Home-Brew-Hex) MKI here, as I have just about finalised the design of the MKII. The centre post and elements are completed, and all I have to do is modify the framework slightly to add a little strength to the design and also modify my Armstrong Rotational Device.

In less than 3-months I've worked 12 new DXCC countries on the Hex (263 > 275) and worked all continents on all 6 bands (30M included) - NO LINEAR. I think for those guys who are undecided as to whether to have a go a building there own, these figures pretty much speak for themselves.

On the down side, I must admit that I'm not happy with the performance on 15M and I'm still undecided whether 10M is OK either (not sure whether its the antenna or lack of propagation?). I don't think these are deficiencies of the antenna itself, but more my slap-dash feed system, and should be fixed up with the MKII.

A quick cost calculation puts all the parts for the MK1 and MKII are around $280AUS of about $145US.

Anyway, best wishes to all and hope you all now have Ducie in the bag.

David, VK2DPD - 28ºC Sunny and Blue Skies

Hi David,

As I understand it, it he was trying to do the 40 & 30 m duo with a single feed line. I rather think the 6 m added might well impact the tuning of the nearby elements adversely, even with a separate feed.

We all await your MKII efforts David.

I could hardly be happier with the HB's performance during the XR0X and VP6DI efforts. I have 3 bands and 2 modes for the VP6DI and 10 bands and modes for the XR0X. (All was 10-20 m.) Coupled with the Quadra, it is a pile buster. Also picked up other goodies such as 3B8, BV, and JY on first calls in the piles. (I rather give dumb luck strong marks and maybe that I recently sent Mr. Murphy on a vacation.

Like WX here, but a tad cooler!

You are invited to have a piece of celebration cake - DXCC - HEX. Go to the lastest "photo" and help yourself. The proof is in the pudding (or cake). Having the HEX beam accelerated an otherwise slow moving process. Note the HEX beam on the cake.

Like any good cake this will not last long so dig in.

554. Photo's - DIY HEX

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-26 08:05:17 UTC
From: David Douglass
Topic: 554 Message: 554

Hi all,

For those interested I've uploaded a few photo's to the Photo section of the Yahoo site (in the VK2DPD folder). These show the centre post and Hub for the MKII version of the Homebrew Hex, as well as the washer tuning system I use for the elements.

The centre post has 5 individual feedlines and SO-239 sockets - 1 for each band. These run up the inside of the post and each line has a ferrite bead choke in place. The attachment points for the elements, are square pieces of plastic (a salvage chopping board - don't tell the missus), that can slide up and down the post for adjustment and to ensure the elements are truly horizontal.

The Hub arrangement is an improvement of the original, in that it consists of the 2 ends of a coax drum (bolted together), with short lengths of tubing to allow slotting of the spreader arms. This will allow a little shortening of the actual wooden spreaders leading to a stronger set-up.

The washer system is simply a washer soldered to each element arm about 18 inches from the end. To this will be attached the rope that holds the arms in place at the element tips. The 18inch overhang can then be taped to the rope and pruned for tuning, without having to totally re-string the whole arrangement. Simple but effective - hopefully.

The next job is strengthening of the spreaders arms and a good coat of black paint (as per the recommendations of Barry).

I'll post more pics as the assembly continues

Regards & G'day

David

PS. Barry, my last QSO before taking the MKII Hex down was VP6DI on RTTY. I think with 3 modes I might even of out-done you on this one mate??

Hello David, it looks really OK ; I'm building one myself for the
moment, and i'll take some foto's as soon as i can.
There' is one thing that i fear of your design : the spacing between
the radiator and reflector to the centre -post is bigger. I don't
know if it's so important, but it might be.
Really clever to work with adjustable plastic attachementpoints!
I wish my boss gave me a week holiday so i could work on my hex....
I'll get there (in a few months...HI..)
good luck!!
Peter

David,

Looks like the MKII is coming along nicely. We are all interested in your progress.

Never heard the VP6DI on RTTY. They did very little RTTY so you really snagged a rare mode from a rare (semi-rare now?) one. Congratulations.

I got the XR0X on all 5 bands and 3 modes (10-11 different band-modes). They were a lot easier to contact than the VP6DI. Also, both the CW and SSB sites at ST. Felix were fantastic. They gave a summary on the Daily DX in a message. Perhaps it will be added to the XR0X web site if not there by now.

April looks to offers some more opportunities to HEX some great DX! GL to all.

From: Makoto Tanaka
Topic: 557 Message: 557

Uncle Barry,

VP6DI was very agressive on 20m RTTY last night (Japan time) and luckily it
was not a big pile up so I got it. Hope
it was a real one.

I got VP6DI on all 5 bands (7 different band-modes) and
XR0X on 20, 15 and 17 (also 7 different band-modes incl.
PSK31 and RTTY).

Good Hexing!!

Good going Shin! I didn't even bother to listen since the following was posted by the Daily DX.

"They will be packing beginning at daybreak 26 March Ducie time, but will be working 15, 20 meter and 75 meter Phone and 40 meter CW throughout the night 40 will be the only CW band for the balance of the operation. There will be no more RTTY or 160 meter operations this trip."

This could explain why there was no significant pile. Hope it wasn't a pirate!

Hi All
5i #199 is now up and working. I had a great time assembling; no problem for one person. Another set of hands would have been helpful for connecting the last couple of wires to the insulator but not a big problem. I am impressed with the ease of assembly and also with the strength of the assembled beam. I was expecting something moderately fragile but I think you could drop it off the roof and it would bounce.
I also got one of their pushup masts which I atached to my chimmey and
here is where I need some more muscle power to push it up the remainder of the way. Currently it is up about 15 feet above the roof which is about 20 feet high so the hex is about 35 feet above the
ground. I am using the Channel Master rotor which works great.
I don't have any experience with rotatable antennas but so far have been impressed with the transmitting ability, of course, but more with
the improvment on receive over a Carolina Windom especially with the decrease in QRM due to the side nulls. It does seem to be more noisy however.
I am used to QRP with portable antennas recently and so I am enjoying having almost all of my calls returned on the first try. (5 watts)
I listened to the hexbeam freq on ten meters Sat but I guess everyone else was otherwise engaged chasing DX.
73,72 and Good hexing Bill K4BYR

Hi Peter,

The actual space between the elements at the feed point is between 5 and 6cm, so not so big. Hopefully this will not effect it too much.

Good luck with your experiment, and maybe you should wait for good weather in the summer hihi.

> vk2dpd@b...
Hello David, it looks really OK ; I'm building one myself for the
moment, and i'll take some foto's as soon as i can.
There' is one thing that i fear of your design : the spacing between
the radiator and reflector to the centre -post is bigger. I don't
know if it's so important, but it might be.
Really clever to work with adjustable plastic attachementpoints!
I wish my boss gave me a week holiday so i could work on my hex....
I'll get there (in a few months...HI..)
good luck!!
Peter

Does anyone have an opinion about the new Fluidmotion SteppIR 3el Yagi
with automagically adjustable elements? Any thoughts about how it
compares to the HX-5Bi?

http://www.fluidmotion.ws
Tnx,
de ken n9vv (prospective Hexbeam owner)

1) It's obviously much cooler than the Hexbeam, in terms of technology.
2) With moving parts, it will not be as rugged (only rated to -20F?
That's springtime in the Rockies.)
3) With moving parts, band changes are not going to be very quick.
4) It's full size.

If 2, 3 and 4 don't bother you.... 1 is very compelling. For myself,
and my QTH, ruggedness and reduced size were paramount.

From: vk2dpd
Topic: 550 Message: 565

Hi All,

For those interested, I've uploaded some photos of the parts for my Homebrew Hex MKII. There are 2 pictures of the centre post, 2 pictures of the Hub type arrangement and 1 picture of the washer system I use for element tuning.

The centre post has 5 seperate coax cables running up the centre (each with a ferrite bead RF Choke. There are 5 seperate SO-129 connectors on the bottom of the post for easy feeding. The connecting points on the post can be adjusted up and down, to ensure the elements are level (these pictures are pre-painting!!)

The Hub is made of 2 ends from a coax drum (as opposed to one on the MKI version), with 6 lengths of aluminium tuce for slotting of the spreaders. This gives a very strong arrangement.

For elemet tuning I have inserted a brass washer into each element approx 45cm from the element ends. This is used to tie to the rope that forms the tip s[aces. The 45cm at the end can then be pruned for best SWR, without having to re-string the whole antenna.

More pic's will follow as construction progresses

David, VK2DPD

567. Center Mast Info needed

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-03-30 02:18:55 UTC
From: genesisjoe2001
Topic: 567 Message: 567

I am almost finished homebrewing my 5-Band Hex.
I would like to know what the spacing is between feedpoints on the center mast of the Traffie 5-Band Hex if someone knows.
I estimate the distance between the 20 and 17 meter feedpoints to be about 11 inches and between the 17 and 15 to be about 7 or 8 inches.
Do any of the hex users have the exact (or close to exact) measurements of these distances for the 5 bands?
This is the last step in my project so any and all replies are very appreciated.
Thanks de Joe AA5HP

Hi To All;

I'd also like to get together with all the other Hexbeamers in Dayton.

Friday or Saturday lunch or dinner is OK with me. Thursday is travel day and I won't be in by lunch time.

I talked to Mike Traffie last week on 15 meters and he asked me to give him signal reports for hexbeams he had on two different towers. One tower was at 30 feet and the other was at 80 feet. The 80 foot tower report was S9, the 30 foot tower report was S9+15to20db. I was really surprised the lower tower had the higher report. See,"Bigger isn't always Better!!!"

By the way, I'm up to 214 countries worked and my DXCC certificate is on the way to me. I'd say the old hexbeam seems to work!!!

See you all in Dayton.

I agree Brad. Suggest that we do it at 1100 or 1300 local to beat the crowds in the food courts. We need to get a list of those planning to attend. Brad, would you be the focal point for this?

With the CQ SSB WPX Contest falling on Easter weekend, the look in my XYL's eyes made clear that "serious" participation (that is, serious by the standards of someone whose last contest "win" was a section award in the 1957 Phone SS) was out of the question. Friday afternoon, I was fooling with an FT-817 I just bought, and a 4X4 said I was a "real" 59plus over there and asked about my antenna. I figured what the hell and showed up on 15 meters at 0000GMT on Friday with the HX-5B and all of 5 watts SSB. Frankly, I was sure I wouldn't have a chance of getting through the massive pile-ups all weekend.

THE RESULT: by the end of the weekend, in 14 hours of "official" airtime (thus, actually much less), on 15 meters only, I logged 223 prefixes, 170,000 points and...73 DXCC entities!!!!!

I may never go back to the Mark V and Quadra (just kidding). And Barry, make sure you're well stocked with 817 goodies in Dayton.

Sorry for sounding boastful, but the credit goes to the antenna, not the op.

73 de Bob, K2WY

Great job Bob. We had thunderstorms here all weekend so I was QRT. :-
(

Congratulations on becoming a proud HAM parent of that little 817!
They quickly become a family member. ;-) I worked several folks
last week on 17 m with the Hex-Beam and my 817 (SSB filter plus the
new speech compressor). Everyone was rather surprised that I was
running 5 W with such a good signal.

I can tell you from personal experience that the MP and Quadra get
very jealous about the appearance of the "little guy." I try to
spend time with them all each week. hi hi

I'll look forward to seeing you at Dayton at the W4RT Electronics
booth. It will be across the aisle from Heil Sound.

578. Homebrew MKII

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-01 07:55:04 UTC
From: David Douglass
Topic: 578 Message: 578

Hi All,

For those following the progress, I assembled the MKII Homebrew Hex and have it on the roof, un-turned at about 17foot.

I'm still to solder on PL-259's for 12 and 10M, but 20M and 17M have a SWR of about 1.4:1 (all be it about 800KHz below the band edge). For some reason I'm unable to tune 15M, although there may be a wiring fault, which I need to check out before I start pruning the elements.

All went to plan, but I've obviously cut the elements way too long (maybe because I used insulated wire instead of the 14SWG flex-weave). This is something to bear in mind when making one.

It's way too soon to say how it performs, but the MKII is mechanically much sounder than the previous model and initially seems to be going OK.

I've took some more photo's but not on the digital, so will take a while to develop and scan onto the site.

A belated happy Easter to all

David, VK2DPD

From: David Douglass
Topic: 579 Message: 579

just to add to my last,

15M is OK and I had a fault on the plug. SWR on 15/12/10 is about 2.5:1 at resonance, but that is with the antenna sitting on the roof for tuning, hopefully this will improve when hoisted up to 33foot.

CU David, ...- -.- ..--- -.. .--. -..

As I had to spend about 23 hours of the contest at church, I only got in about 14 hours as well. Knowing that I couldn't be competitive for score with that amount of time, I went for DXCC entities only, S&P.

Antenna: HX-5bi #203 on 10, 15, and 20.
Rig: TS-2000 running 100 watts (N1MM automation -- nice program!)
Results: 88 DXCC entities.

(Side note: did you know that you can work Colorado to Venezuela at midnight on 75 meters using only 100 watts into a G5RV at 30 feet?)

Look at the math:

St. Louis, MO: 38.63N/90.24W
Ashby, MA: 42.67N/71.82W
Distance = 1005 miles

A 15 meter horizontal antenna at 1.7 wavelengths up will have gain lobes at 8, 26 and 47 degree takeoff angles, and nulls at 17 and 36 degree takeoff angles. At 0.65 wavelengths up, it will have a single gain lobe at 22 degrees. A=asin(N/4h)

For a 1005 mile F layer path, first F layer hop will be at a takeoff angle of 13 to 20 degrees, and second F layer hop will be at a takeoff angle of 30 to 40 degrees.

As you can see, the higher antenna has a null at BOTH hop angles, whereas the lower antenna has a gain lobe at the first hop angle. This was true for the exact distance and heights seen in the experiment -- if the distance had been 250 miles closer or farther away, and the results would have been reversed.

Furthermore, raising the low antenna to between 35 and 47 feet would have beat them both, as this would be the ideal height for 1000 mile, 15 meter, 1 hop, F layer paths.

Yup! Given the realities of antennas and propagation, I think a motorized tower is probably as valuable as a rotator -- although much more expensive ;-)

I'm personally thinking about an MA-550MDP...

That is exactly my plan Tom. I will be refurbing an old 50' EZWAY tilt-over, crank-up tower this summer. While I have the welding stuff out to touch up anything necessary on this 42 year-old jewel, I plan to add a mount for the motor. Brian is right on. Remember that on 10 m, a Hex-Beam at 38' is already dual lobing.

589. Homebrew Hex SWR

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-02 11:28:20 UTC
From: David Douglass
Topic: 589 Message: 589

Again, for those adventurous amongst you!!

I have carried out an initial pruning of elements and have the antenna at about 15foot (4 foot above the metal shack roof).

Initial SWR readings are

20M - 14.00mHz SWR = 2.3
18M - 17.89mHz SWR = 1.8
15M - 20.88mHz SWR = 2.8
12M - 24.84mHz SWR = 2.2
10M - 27.88mHz SWR = 2.7

These may not seem that good to you guys with commercial antennas, but I think they must be the best set of SWR readings I've ever achieved in any of my homebrew arrays.

SWR bandwidth seems pretty good, and I intend to raise the antenna to full height before doing any more chopping.

More to follow - Regards

David

590. tower/mast wind loading and guys

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-02 19:23:40 UTC
From: n6tz
Topic: 590 Message: 590

While it might be advantages to have a small wind load like the Hex offers, consideration to wind loading is still important.
The basic formula for wind load is Pounds per Square Foot is equal to the Velocity of Wind in MPH Squared divided by 250. Or in simple form LBS = VxV / 250.
Now most of us consider the Traffie Hex to be about 2 sq. ft. and then the Channel Master rotator another square foot, so let's look at figures.

At 10 mph wind we will have about 1.2 lbs of side force.
At 20 mph wind we will have about 4.8 lbs of side force.
At 40 mph wind we will have about 19.2 lbs of side force.
And at 60 mph wind we will have about 44 lbs of side force.

Considering our guys will be at best at 45 degree angles, but often less than that, your guys for a 60 mph wind will have to deliver at least, and probably more than 62 lbs of stability. This is not to mention higher amounts due to oscillation of the weight. A general rule is you need at least 100 plus capability for the Hex. So think about this when you guy with dacron cord or other light material. There is no substitute for steel cable with eyelets, quality egg insulators, and proper clamps.

In addition to my previous posting on wind load.
Remember, when rating a guy cable/rope/etc., always calculate the worse case situation, then look for rating of material at least two to four hundred times capability.
For instance, if we calculated 100 lb need, then we would use material of 200 to 400 lb strength.
On the use of fabric materials, think twice if you have trees nearby with squirrels. They love to chew on those materials and take them for nesting material.

From: David Douglass
Topic: 593 Message: 593

Apologies as you are all probably getting a little bored with all this ''Homebrew Stuff''.

I have just uploaded a graph of SWR plots for the MKII Homebrew Hex now raised to full height, and tuned (as best as I can be bothered at the moment). Resonance is out of band on 17M and 10M, but not by that much, and I've had enough climbing on the roof for a while.

SWR readings are not as good as I would of expected with single feeds, but 'what the hell'. These readings are actually on a Autek RF-1 at the end of the cable in the shack, whilst strangely enough, the SWR readings are a lot better on the rig's internal meter (all less than 2:1 across the band).

Anyway I'm pretty close, so now its off to try it all out.

Seems to me that would have to be 20,000 - 40,000 Lbs if we used that
criteria. Probably hold up the Seattle Space Needle ok. :-))

Hi David, not bored at all!!! My attempt will be one-line-fed system (just to have had the experiance...)sorry it take's a long time untill i'm there, but you can count on it.
I'll make a "flexibel"connection between the end of the radiator and the feed line , so i can find the right place to make the connection using a clamp. For the lenght adjustment of the radiator, i'll use a turnable device which can be turnend in or out so it changes in lenght. (the foto's will make it more claer i hope...as i know my writing isn' hi... :)
Greetings to all
Peter

Peter,

Thanks for the mail, and sounds interesting.

One other thing I would suggest is to make sure that you can adjust the points at which the elements connect to all spreaders, such as using hose clamps that can be moved up and down on the spreader. This way you can remove any slack from the elements when assembling. I ended up having to take out the slack with cable ties.

I was hoping for a little better SWR on this antenna, but it is not so bad and I have already made a few QSO's, even though conditions are poor. I have F/B ratio on 20/17/15M of about 2-3S points, but no propagation on 12/10M at the moment to try.

Also what I did find was that the SWR changed quite a bit from having the antenna just above the roof (approx 5m high), to putting it up to 10M high. This may also be because my shack roof is metal. (Barry take note!! I should of taken more notice of you, and I wouldn't of went out of band on 17M!!)

Good luck and again, thanks for the mail

David, VK2DPD

Very interesting. Yep, the resonance does vary a fair amount from the low to operational height. Great progress. The F/B seems about right. Hope the gain is good as well.

Congratulations on working Ed the P5. I don't know what it will take short of him calling for US only by call zones or by call signs (hi hi)for us to work him. Heard him twice at very low level and those pesky US West Coast stations cover us East Coast guys up (plus we have a nastier polar path to follow. :-(

Herb,

I hate to get into this but maybe Barry has a point. Both coasts seem to have a pretty easy go of the DX. I have often heard stations calling for the "west coast only". I can't imagine why they would do that as I sit here in the RF depressed gulch of the middle US. Our DX is further no matter which way you go. Maybe if you are within a couple of hundred miles of the Mississippi River DXCC credit should be given for only 90 confirmations.

And about "defending those who live elsewhere and who are not blessed with the Californian Lifestyle. We are the salvation of the Nation, defenders of the American Way, and rightful owners of all DX that is good!" Oh my! April Fool's day is past ya know.

I'm really looking forward to meeting you guys who can get to Dayton.

And there's more!

Well, F/B ratio seems good on all bands 20-12M (still no propagation on 10 to check), with between 2-4S units depending on location of DX station. 15M operation seems to definite improvement over the single feed antenna, so looks like the change may be worthwhile after all.

The antenna even had to weather its first storm today, so hopefully it doesn't all come apart on me.

Nice job Joe and David. It looks like you are running the coax feed down the mast between the hot and cold legs of the driven element. For whatever reason, the commercial version elects to route the coax between the driven element cold leg and the adjacent reflector leg. Continued good luck with your evolutions.

610. HexBeam Measurements . . . .

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-05 16:52:55 UTC
From: g4mjw
Topic: 610 Message: 610

Hi all,

I am new to the group. When the WX is fine, I am found outside making "Wire" aerials. When it's cold and wet on goes the soldering iron in doors!

I have recently made a few Mono-band 2 ele wire beams for 15 mtrs. A VK2ABQ, a DDelta (double delta loop) and a quad. The DDelta is the easiest to make, very light, has more gain and better F/B ratio than the 'ABQ and abt equal to the Quad. I have made a mono-band Hex Beam for 15mtrs from some info given to me on a scrap of paper. According to the note, the measurements were calculated from 520/F. Cut for 21.300MHz my driven element was 24ft-5" and the refrlector 25ft-5" OA (4% larger). When set up on a 12ft pole, the array is resonant @ 20.500MHz'ish

I have progessively "Trimmed" the driven and reflector (maintaining 4% larger than driven) and it is now resonant on 21.250MHz with an SWR of 1.5:1 I have not maintained equal leg lengths . . infact it's now well out of shape and the angles are 75-80 degrees! I worked KW1I - Dale in New Hampshire on AM (regular sched) and my report was abt the same as my Ext.D.Zepp up at 55ft, So it's working. As with any beam, it will be different up on the mast. It'll take me the best part of the day to take other antennas down and get the beast up. I would like to check all the measurements, angles etc to see if any improvements can be made in advance!!!

Can someone tell me where I can obtain the measurements and figures for a mono-band version. It seems I have done my favourite . . . tried to re-invent the wheel!

Many thanks - Bye for now - Steve/G4MJW

I think I may need to retract my earlier statement about being silent! Mr. Brad (K0TRL) has called into question my understanding of life outside of California, and thus I must respond!

I was born and raised in Jamestown, New York which is in the southwest corner of New York state...about 60 miles south of Buffalo, NY. Lived there for 20 years! For those who don't know the area, it is the "snowbelt" of the state, with lots of snow coming from the Lake Erie area. Thus, snow, ice, salt on roads, snow tires, rusting cars, etc.

I then spent 2 years going to school in the most god-forsaken place in the USA... Houghton, Michigan. This is in the upper peninsula of Michigan on a small stub of land that sticks out into Lake Superior. The yearly snowfall averages 300 inches...they have city snowblowers for the sidewalks as well as the streets, and people build temporary wooden "bridges" from their front porches to the street!

Lastly, 3 years in Cambridge, MA doing my doctoral work at MIT. The Cambridge/Boston area is hot+humid in the summer and cold+wet in the winter.

I HAVE PAID MY DUES...AND THAT IS WHY I LIVE AND DX (AND DON'T SUFFER) IN SOUTHERN CALIFORNIA!

Are there any questions? If not...class dismissed.

From: Joe C
Topic: 613 Message: 613

Thanks to David for posting my pictures to the users group.
I was not sure how to do it.
I am using the formula of 6160/f for the Driven and 6262/f for the reflector for all bands.
By my calculations that makes the reflector a little less than 2 percent difference between the driven and reflector lengths.
Some homebrewers are making the feflector 4 percent bigger.
I wonder which is better?
Any Thoughts Guys?????????

I am using an antenna switch to remotely switch bands. My next photos (hopefully next week when the thing is strung and put up) will include pictures of the hub/mast with the antenna switch installed.
I hope that feeding each band seperately will reduce interaction and make it easier to make SWR adjustments when it is put on a push-em-up pole here on top of my work QTH.

Will keep everyone posted as to my progress.

ok david. I'll have the same problem when i start tuning because i' have limitted space . i have a plastic tube of about 6 meters where i'll will put it on , put it's a bit "gelly"
i'm building also a mast which can be lowered down to about 4 meters and it will be 10 meters high when it is at it's biggest hight.
it is constructed of two poles which fit in eachother. The outer pole is driven into the ground for about 5 meters using water and air.(i know, i have stranges methods sometimes...). The result is a pole of 4 meters above the ground when it is not erected.(my neigbours like it that way...so does the misses.:))
what kind of change in the swr did you see? whas it the same on all bands?

Oh i almost forgot! we have another thing in common : here in Belgium
we have the finest beers of the world!...(ok , europe..)we produce
about 350 kinds and were o so small(as a country that is)The
Britisch people just love to come over, but they can't hold up there

I have to agree Peter regarding the fine beers in Belgium. While teaching for a short while there, I made a gallant effort to try the 300+ different beers available in the town. Having a Scottish and Irish heritage, I don't suffer the modest problem of the English with holding a few pints. ;-) Perhaps a few extra will help the tuning of the Hex-Beam!

Hi Chris,
Thanks for the good report. The A4 was a new one for me. Also got two more new ones today. One was HFP0POL anf the other was ET2PMW. The ET was reportedly operating QRP! Getting 3 new ones in a day is becoming a rarer event now that I am at the 260+ level.

In answer to your question about power, I was running a FT-1000MP and VL-1000 amp. Peak output power was 1000-1060 W and the average output power was 750-850 W. I use a Heil Goldline microphone with a Studio element. My processing and other adjustments are made to give the sound of an enhanced Heil HC-5.

I now have you on my watch list of call signs Chris to work. Hope we chat soon (with a Hex-Beam above your roof would be nice). :-)

Hi Doug,

That's an interesting point, and to be quite honest I could never figure out why it was recommended that you run the coax down the side on the HX-5i??

I would of thought keeping the coax down the middle and symmetrical would be the go, but I'm sure someone will correct me. I also could never figure out why the elements on the HX-5Bi were not fed at the bottom (10M), if there was an issue with the coax cable effecting things, as you expect the coax to have some effect on the twin feeder in the centre pole??

Anyway, it seems to work OK with this method so have no plans to change - that is unless someone has a good reason why I should??

Regards

David, VK2DPD.

Well David, glad to see that you have learned well from your VK friends. All of my friends from there can out-drink anyone else I have been around. I rather agree about the Budweiser beer, but we do have some fine ones as well. Nigel made a good point too. We have lots of fine Irish pubs, but never have seen an English pub here. (I do enjoy going to them while in England I must admit.)

In trying to keep to the Hex-Beam topic, I do remember Traffie telling me that it is important to run the coax as previously mentioned, but I can't recall his explanation. He said that it did make a difference in performance.

Keep you the FB development.

Hi David,

I agree, what some Americans consider beer is rather like water...

While it may be nice to hydrate oneself while mowing the lawn with a Coors light or Budweiser, a good solid pint requires something a tad more robust.

As far as holding a few pints, I never trusted a man who could not hold a few pints or appreciate a fine ale.

As an aside, my cousins are in from Liverpool and the first thing they said to me is,...." how do I survive with my local being more than a few miles away." Now that's what I call prioritization !.

Best 73,

Nick
N2QXF

(Who is going to appreciate two or three pints of some fine Caffery's Irish Ale later today)

Doug,
I don't know why the commercial hex coax is run like it is.
I may find that when I put mine up this week that running the coax between the hot and cold legs may cause some unexpected interaction. I am winging this as I go but will certainly let you know what happens when it goes up. I figured that using seperate feeds would help eliminate any interactions and also make it easier to tune individual bands if necessary. I am keeping my fingers crossed.

Hi Steve and pleased you found the information.

I had to shorten mine quite a bit, but I was using insulated wire which does have a different velocity factor. Be care with adjustments as resonance does vary with high. I did my adjustments at about 15 foot (on the roof), and when I raised the antenna resonance seemed to shift up the band a little. This could also have had something to do with the fact the shack roof is metal also.

Good luck

David

Thanks for the info David.

Have checked the caculations against mine and they are prety close.
The "Test" Aerial is only 10ft AGL . . . . so it's time to put it on
the mast and try it out at 50ft!!!

Thanks for yr help - Steve/G4MJW

Hi Barry,

Would also agree. What is lacked in quality (Australian beer is pretty awful), is made up for in quantity, as people drink heaps of the stuff. Whilst I can stomach it, at a push, I much prefer the imported stuff. Being from Newcastle in the UK, I'm lucky in that Newcastle Brown Ale can be bought pretty much around the World, along with Guinness. What more can a man want out of life??

Well David, glad to see that you have learned well from your VK friends. All of my friends from there can out-drink anyone else I have been around. I rather agree about the Budweiser beer, but we do have some fine ones as well. Nigel made a good point too. We have lots of fine Irish pubs, but never have seen an English pub here. (I do enjoy going to them while in England I must admit.)

In trying to keep to the Hex-Beam topic, I do remember Traffie telling me that it is important to run the coax as previously mentioned, but I can't recall his explanation. He said that it did make a difference in performance.

Keep you the FB development.

Happy Birthday to W4WB (AKA "Wild Barry") as he continues to subsidize the AARP and HexNuts worldwide. How many BTUs are typically generated by 56 candles? I need to know as I will follow suit in about 3 months and may have to file paperwork with FERC, FEMA or the local 911 dispatcher.

Gads Doug! That new call sign of yours must now mean "W6 Happy Birthday." Thanks for the kind wishes. I am just hoping that I make contact with Ed, the P5, today. A friend in the DX Club was just issued W4BC. His first DX contact was the P5! Bad news is that he was not using a Hex-Beam.

Good going Joe, and fine on the name. I'm hoping that band conditions pick up soon so I can give it a try out, but did work a few last weekend in the EA RTTY contest, so I know it's radiating.

Good luck

David

David,
I made some mechanical misjudgements when I was stringing the 20 meter elements.
No miscalculations, just put the "cart before the horse" in my order of assembly steps.
It is all okay now but what a frustrating time I had until I realized what I was doing wrong.
Can't wait to finish the other elements and get the thing in the air for testing. Unfortunately it stormed yesterday and is still raining today.
Never fails when you want to put an antenna up. :(

637. Real world modeling.....

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-12 02:47:30 UTC
From: w6hb
Topic: 637 Message: 637

I was just conducting a real world modeling of the HX-5Bi at 30 feet. The program used was the FT-1000MP into 100' of RG-213 without benefit of supplemental power. The path was 71 degrees with D2BB as the target. Despite an appreciable pileup that modeling won't address, Ginge found me in the din and responded with a 58 report. He was about 55 at the time. Too bad the Hexs are only a degraded 2-element Yagi!

Doug - W6HB

638. Homebrew Hex Results

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-12 03:41:01 UTC
From: Joe C
Topic: 638 Message: 638

I just put up my 5-Band Homebrew Hex (Pictures Coming Soon) and worked, in a matter of 15 minutes, CN8, TM9, 9K2, all on 15 Meters this evening. All signal reports were 5-9 running only 100 watts to the antenna. I am feeding each band separately into a remote antenna switch. The SWR is 2:1 or better on all 5 bands. The elements are aparently a bit too long. I think this is due to having 5 bands so closely arranged which is causing some added coupling. With a small amount of pruning, I hope to be able to get the SWR below 1.5:1 on all bands. By the way, my Hex is at about 35 feet here at the work QTH.

639. POP-UP ADS - A Method to stop them

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-12 04:16:19 UTC
From: w4wb
Topic: 639 Message: 639

I having been using a program that filters out the ads on the Hex-Beam Yahoo! site and other sites when using IE and NS browsers. So far, the free version is highly effective. By that, I mean that most ads go away while just a few still display. No downsides have been noted yet. The program has the ability to filter a lot of other content as well.

The program is call Ad SUBTRACT and can be downloaded from http://www.adsubtract.com/products.html. There is a "delux" paid for version as well of course. A SPAM SUBTRACT is promised soon.

I must say that having the screen clear of the clutter is nice.

Very good going Joe, and sounds like your off to a flying start and working DX already.

I still need to do some tuning at this end but seem to have decent F/B ratio on all bands, and SWR is good enough until I can be bothered to get back up on the roof. It seems like you guys are having all the luck with the Dx at the moment, and condx are pretty poor down here at the moment - "well I suppose there has to be some advantage to living in the US"

Looking forward to the photo's also Joe and good luck with VK9ML coming up.

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-12 15:59:27 UTC
From: Joe Caluda
Topic: 638 Message: 644

I used a stock 6160/f for driven and 6262/f for reflector formula on all bands.
I think that when you multi-band this, the lengths have to be shorthened a bit because my resonant points were consistently lower than figured in initial calculations and SWR is almost exactly the same 2:1 at resonance on all bands. Very interesting.
Next step is to prune a bit on each driven (I think I will leave the reflectors alone for the moment) and see if I can get the SWR below 1.5:1 on all bands.
The antenna is definitely "playing" though and I am very excited with initial results.
I will take photos on Monday and let you see what the completed antenna looks like.
Thanks to all members for the help and guidance and especially David, VK2DPD, for his homebrewing experience and support.

Hi Phil,

See you managed to log into the Yahoo Site. I wonder if you have had any luck getting the article by Mike Traffie from the file downloads area??

Good to have you on board

Have just uploaded a couple more photo's showing the completed MKII Hex, into the VK2DPD folder.

I have noticed 1 disadvantage of the single feed method, this being the decreased performance on 30M. I suppose this is due to having a lot less wire operating.

Oh well!!

Regards

David

David,
Are you using an actual 30 meter element or are you using the other
bands with a tuner?
The spreaders for the 30 meter hex must be 13 feet long or so right?
Interested in what you are doing for 30 meters.

Hi Joe,

No I'm only using the 20M element tuned down! With the old multi-feed system the antenna seemed to work a lot better on 30M, but then again, there would of been a lot more wire up there!

However, I'd still say I prefer the single feed system for the better performance on 15 and 10M.

David,
Photos look great.!
I am gonna take some pictures of mine now that it is up and will try and post them in my folder that you created.
The antenna is working really well.
I just need to do a little pruning to get the SWR down.
Using seperate feeds sure makes it alot easier to get the SWR down on the individual bands.
I am using an old heathkit HD-1481 remote antenna switch that is working just fine too.
Did you use the stock formulas of 6160/f for Dr. and 6262/f for Ref.?
In my case, those numbers made all the elements a little too long.
So if any others are homebrewing like you and I, I would adjust those formulas to perhaps 6075-6100 for Dr. and try leaving the Reflector number at 6262.
This should bring the resonant frequency down to where you want it.
Will give you an update after the pruning is done.

Keep up the great HB (Home Brew) work Joe and David. As you seek a lower VSWR, remember that the characteristic impedance of the Hex is around 20 to 25 ohms. Don't confuse it's resonance for it's point of lowest VSWR. If you have the MFJ-259 or similiar, you might want to find out where reactance is zero before you start cutting. To use the old line, "I cut it seven times and it is still too short!"

From: David Douglass
Topic: 648 Message: 653

Hi Joe,

Yep, used the same formulas here, but had to prune quite a bit off to get resonance. I still need to play with 10M as the low point is around 27.85Mhz but the rest are OK. I agree that single feeding makes things easier, but there still seems to be some interactions between elements, although I suppose not as bad.

Still waiting for condx to pick up to really try it, but seems to be working OK.

Just worked A25/G3CHT on 12M!!

Thanks Doug and all OK.

Thankfully I have an antenna analysis here, which helps a little, so managed OK to find resonance, although I'm a little high on 17M due to changes with antenna height, but nothing to worry about.

I see VK9ML has started up, so there's another one for you guys to chase for a week or so. Good luck

David

From: Makoto Tanaka
Topic: 655 Message: 655

Hi,

I got VK9ML on 15m CW after 30 minutes call with 200watts.
It is the first day for them to come up and pile-up is booming.

BTW, following my article, JA3MHV posted his article after
intensive simulation and assembling his homebrew Hexbeam.
It is very intersting article. If I have a permission from the
author, I will briefly translate it for your interest.

From: Herbert Meiselman
Topic: 658 Message: 658

Yeh...I agree! No big deal to work VK9ML when they are within visual range (hi hi).

You should try to do it the California way: 10 microwatts long path!

Regards,

Herb K6HJM

PS: I tried this AM and "think" I got him...short path and an Ameritron 811H amp.

From: Herbert Meiselman
Topic: 663 Message: 663

Dear All:

I am still unclear as to the reason for Barry's behavior toward me. I have almost stopped telling the truth about him, and am doing my best to refute the lies and mis-truths told by numerous evil hate mongers. Nevertheless, he still attacks me (AM versus A.M. in his latest message!).

Although I am a sensitive and sincere individual, I have been able to overcome his outrageous verbal attacks:

1) got VQ9GB (Chagos Island) this morning on 21.281 at 1611
2) got OH0JTU (Aland Island) this morning on 21.284 at 1616

Both on first call using the Hex-Beam. Also, both new ones for me!

SO MR. BARRY (aka Barry The Wise, Barry The Elder, Uncle Barry)..."sticks and stones will hurt my bones but words will never harm me".

Hi Barry and all,

Yep, it gets a bit frustrating when the Dx is working either JA, NA or EU all the time, but I can see their point, as there are only a handful of people over here who bother seriously with DX. Can't complain too much as we usually get our turn.

Just worked VK9ML on 30M CW, to complete all bands from 16-10 inclusive! "Now I wonder if I can knock up a 6M Hex in time???"

73's to all in the crowded hemisphere

670. Homebrew Photos Posted

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-18 03:04:13 UTC
From: Joe Caluda
Topic: 670 Message: 670

Thanks to David, VK2DPD, photos of my Homebrew 5 element Hex Beam in its operating position have been added to my folder.
Each band is fed seperately to a Heathkit Remote Antenna Switch seen directly under the main hub.
Antenna is working great except resonating a bit lower in the band than planned.
WIll attempt to do a bit of pruning over the weekend and see what happens to the SWR.
Thanks David posting my pictures and the homebrew advice and information.
Joe AA5HP

672. David's Shabby (?) Homebrew Hex

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-18 13:01:03 UTC
From: w4wb
Topic: 671 Message: 672

Hi David,

Does appear that Joe has done a FB job. Nevertheless, your Hex has demonstrated great performance and shows that this antenna form can be realized with some robustness. By this I mean that the Hex-Beam concept isn't a "high-Q" tuning challenge, but is tolerant. This is good news for everyone in that it implies good long-term operation with performance maintained.

Now if the MUF will rise again, all will be good with the world.

Topic: 671 Message: 673

I have to add that David's Hex is one of the main the reasons my antenna
looks and operates like it does.
My design and building concepts are the result of ideas gotten from
EI7BA, Traffie Technology, and especially David, VK2DPD.
Thanks to David's experience and ideas on construction and tuning I was
able to put together a reasonably well-built and very good, functioning
Multi-Band HEX Beam.
I am sure that someone will see the pictures of my antenna and take the
construction even farther.
Thanks to all the nice reports on my Homebrew Hex but the construction
ideas were a mix of inspiration from many sources.
Now to get the SWR just a tiny bit lower in the protion of the band that
I want to operate in.
Wish me luck with the pruning.

674. Home page image

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-19 09:41:40 UTC
From: w4wb
Topic: 674 Message: 674

The home page image showing the various installations is missing. This is because the image was stored at my w4wb.com site and that the ISP vanished a few days ago. Guess they went out of business; no trace of them. My domain should be active with the new ISP in a day or so. At that time, the image will reappear.

From: jr1nhd_shin
Topic: 675 Message: 675

Hi Hexguys,

Hunting for my backyard VK9ML is in very good shape. Missing are 20m SSB/RTTY and 10m RTTY among HX5-Bi coverage.

BTW, is it an idea to make a Hex T-Shirt to show mutual friendship among this group? Does anyone volunteer to design and order in NA? (Such cost should be higher in JA, hi). Those who get together in Dayton should recognize each other.

I have another Hexuser in JA who plans to install during first week of May. My article in Five Nine have impressed lots of JAs, which pleased me as well as Mike T.?

The shirt sounds like a great idea, Shin. I would be willing to interface with a local shop that has done silkscreening for my business and the United Radio Amateur Club (K6AA). I won't be able to make Dayton this year and am not sure if we could get something in time. Maybe Barry has a contact through his business associations that could do better or faster. Condider this posting as a FORMAL REQUEST FOR ART WORK IDEAS from all HEXNUTS. An existing LOGO possibility is that used by Traffie is he would approve it. Maybe we could have little stick figures with HEXNUT heads. All ideas are welcomed.

677. Old Sol is Hexing Us

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-21 03:38:41 UTC
From: w4wb
Topic: 677 Message: 677

These solar storms and ejections have really kicked the A value up and the S number down. Even the FB Hex-Beam and a KW can not make much headway.

I have enjoyed some fun QSOs. Yesterday morning on 20 m, the only guy I could hear was in Bombay. He was a 55 to 56 and I was 59+ he said. Clearly was a ducting path. He faded away about 10-15 minutes later. All of a sudden, ZD8Z jumped out of the noise on 10 m about 2100Z at 20 over 9! Easy contact. I worked 5N6NDP on 20 m yesterday and 15 m today. Again, he was just one of a few stations I could hear. The only good thing about the present conditions is that we can actually experience some interesting propagation paths. Hope it all clears soon so that I can make some more VK9ML band/modes contacts. FWIW, VK9ML announced that they will concentrate on the eastern part of the US and Africa when the conditions improve. Guess they have worked every possible VK, ZL, and JA by now with us all blocked out. :-)

Barry,

I think the reason they have been working so many JA, VK and ZL stations is that they need some intellectually stimulating QSO's after working all those US stations.

Regards

David, VK2DPD

679. OK, so it's not a Hex

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-21 04:36:33 UTC
From: David Douglass
Topic: 679 Message: 679

Hi all,

I know this is the wrong place for this, but I realise that a few of you guy's don't have any antenna for the lower bands.

To supplement the 5 bands on the Hex I've just made a 80/40/30 vertical based around one of those 10M DK9SQ telescopic poles. Basically the antenna is a 1/4wave vertical on all bands. 40/30 are both full size, whilst 80 is centre loaded.

I have uploaded a "very primitive diagram" into the photo section in my folder, showing the basic layout. The antenna consists of 3 sections as follows

Sec 1. 30M 1/4wave vertical.
Sec 2. 80M loading coil
Sec 3. 40 extension whip.

For 30M all sections are disconnected from each other, basically giving a full size vertical. On 40M Sec 1 and 3 are connected by a jumper cable (cutting out the 80M coil). This again gives a full size vertical. On 80M all sections are connected in series to give the centre loaded 1/4wave vertical.

The short counterpoise is one I've been using on my 40M vertical and discussed in length by Les Moxon, G6XN in "HF Antennas For All Locations".

So there you go, apologies for the post, but thought some may be interested, and if anyone wants any further details, e-mail me direct to avoid clogging the reflector.

Hi Barry, and apologies for the little dig, but couldn't help myself.

Good going on working the ZD8!! I still need ZD8 and ZD9 here, and that is about the most tricky path there is for us from here.

I'll give you a few more details on the antenna once I've tried it out. If you've looked at the picture you will see that, band changing is a problem as you need to take the antenna down to swap over the jumper leads, although its a simple task when the mast is light-weight fibreglass.

I'm expecting good performance on 40/30, but will see how it goes on 80M, as I've had some disastrous efforts on that band in the past.

Anyway, hope the conditions pick up for you and see you in the pile-ups for KH1 in a week or so.

Regards

David

Ah ha! So they are using 56, 43, etc. rather than just 59 now. ;-)

Use the tower as a verticle, the hex-beam makes a pretrty top hat to lower the resonant frequenct.

Hi Nigel,

Wish that was an option but the mast here sits on the metal shack roof and
is only about 22foot long.

David,
I am curious when you load you 20 meter hex on 30 meters, what is the SWR like?
does it show any directivity, FB or gain?
I have not loaded mine on 30 but will soon.
Also an interesting discovery of mine.
I was using the 5-bander hex with a TS-820. A couple of days ago I hooked up a
kenwood TS-570 and noticed that the SWR meter on the 570 showed a much lower SWR
than did the 820.
Any thoughts on this. According to my 570 the SWR is 1.5:1 and lower.
According to the 820 with an outboard meter, the SWR was 2:1.
I wonder how accurate the SWR meter on the 570 is?

Look forward to the feedback .

Hi Joe,

Currently the SWR on the 20M element when fed on 30M is 8:1. I need an external tuner to tune this down as the internal one in the rig won't handle that.

I can't remember what the reading was like with the multi-feed system, but performance was much better, which I put down to have a lot more wire active at any one time.

This is measured on my Autek Analyser, and I get totally different readings ion the rig and external SWR Bridge.

Hope this helps.

CUL

689. Would You Be an User Reference for the HEX-BEAM?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-22 23:56:07 UTC
From: w4wb
Topic: 689 Message: 689

Hi Folks,

Mike Traffie and his crew will be showing the Hex-Beam at the Dayton Hamvention next month. Several of us have asked Mike if it might be useful to have a list of Hex-Beam owners that people can contact about the user's thoughts on the Hex-Beam. I recall that I asked Mike for a couple of references before I would buy it myself. Best part about doing that was I made two new and fine friends in the process.

If you would be willing to have potential HEX-NUTS call/email/write you to discuss the Hex-Beam, then kindly send me the following information for the list to be handed out in Dayton.
1. Name
2. Call Sign
3. Email
4. Phone number (and times when you will take calls -- give time zone pse) [optional]
5. QTH (optional)
6. Type Hex-Beam you have, e.g., HX-5Bi

Please send your information to me by email at barry @ w4wb.com (pse leave out the spaces however) or to the email address in this posting.

From: Herbert Meiselman
Topic: 690 Message: 690

Hello to all:

Well, this could be a momentous day! I actually and completely agree with Barry (W4WB). I think it would be a great idea to have Mike Traffie be able to provide our names as current HB users. Makes sense to me. Probably because I seem to have gained two things as a result of buying my HB: 1) a great antenna that works well at my QTH in spite of space, height, mountains, etc limitations; 2) a new group of acquaintances (dare I say friends?) who share an interest in HF, DX, etc.

I clearly recall making a few phone calls prior to buying my HB, and I think others might like the same option prior to getting theirs.

I strongly encourage you to sent the information to Barry. This time I am serious...no jokes!

I checked the tighness of the bolts and nuts associated with the tower and antenna assembly this past weekend. I found things in pretty good shape with the exception of the allen set screws on the upper and lower hub. They had worked loose. So don't forget to put your allen wrench in your back pocket when you do your spring tuneup.

Hello friends,

my name is Boian Petkov, LZ2BE since 1981. I would like to install a multiband antenna on the roof of my house and to use existing TV rotator. It looks that HX5B (20-10m) is the best choice for me, according to all I red in Internet.

I would like if somebody can help me with the right dimensions of this antenna or formulas to calculate it.

Thanks in advance!

A week or so ago, there was a suggestion of using the mast and hex as a vertical antenna with the Hex as a top capacity hat. This would work fine but two common problems must be considered.

First, the reflectors on the Traffie Hex are not common to the mast. In other words, they are floating. I discussed this with Mike Traffie and he did not know if it would hinder the normal operation of the Hex if one tied all the center points of the reflectors together and tied them to the aluminun spreader holding plate. As the Hex is constructed presently, the reflectors offer no top loading.

Second, Many of the Hex users are putting a coax choke or isolation ferrite rings at the point just where the coax meets the Hex. This will offer some reactance to the current coming up the coax when the mast is used as a vertical. The lower the band, the less reactance these two forms of isolation will have. This limits the amount of top loading the driven element offers.

Something to think about.

I will be shunt feeding my mast with the Hex on it, and will complete an appraisal of the effects of tying the reflectors together with a tracer wire going from lug to lug and down to the aluminum plate. As far as the coax isolation, well, we can only do what we can do. My installation already has about 1,200 feet of ground radial wires coming to the bottom of where the mast will be. I will feed the mast with a slope wire at the 30 foot mark and from a tuner located about 15 feet from the base of the mast. The metal aircraft cable guy wires will be broken with medium size egg insulators. My mast is a 50 foot version with extra overlap, so the total height is about 39 feet.

Hal, N6TZ

Yep...old Herb in Altadena, California worked K1B with the HB. Did it about 3 hours ago at 17:30 PDST. Pretty neat..was on my third call at 5 kHz above the 21.295. Damn...the HB really works great!

Now all we need to do is to help Mike Traffie sell a few more so that we (the current users) are assured of continued support, parts, love, attention, respect, etc.....

Hal,

Good going and hope the Hex works OK as part of the "vertical arrangement".

Following from my last, I have redesigned my vertical with a big loading coil at the bottom with taps for 80m Phone and CW and one for 160M. On 40 I bypass the coil and have a full size 1/4wave vertical, and I'm going to set up a system where I can put a capacitor in series in the 40m element to give me 30M.

The base loading will not be as good as the old centre loading, but saves having to take the antenna down everytime I change bands.

At least it works on 40M as I've just worked K1B!!

Then again I wish I had a real tower I could shunt feed!!!

Regards

David

This limits the amount of top loading the driven element offers.

Something to think about.

I will be shunt feeding my mast with the Hex on it, and will complete an appraisal of the effects of tying the reflectors together with a tracer wire going from lug to lug and down to the aluminum plate. As

far as the coax isolation, well, we can only do what we can do.
My installation already has about 1,200 feet of ground radial wires coming to the bottom of where the mast will be. I will feed the mast with a slope wire at the 30 foot mark and from a tuner located about 15 feet from the base of the mast. The metal aircraft cable guy wires will be broken with medium size egg insulators. My mast is a 50 foot version with extra overlap, so the total height is about 39 feet.

Hal, N6TZ

Herb, I thing the problem is the price, in my case is dificult expend that money in an antenna, for that reason i making a homebrew hex. regards Humberto --- Meiselman escribi?: Yep...old Herb in Altadena, California worked K1B with the HB. Did it about 3 hours ago at 17:30 PDST. Pretty neat..was on my third call at 5 kHz above the 21.295. Damn...the HB really works great!

Now all we need to do is to help Mike Traffie sell a few more so that we (the current users) are assured of continued support, parts, love, attention, respect, etc.....

73s,

Herb K6HJM

702. K1B - Embarrassment & Shame

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-04-30 04:11:30 UTC
From: w4wb
Topic: 702 Message: 702

How hard it is to confess that I just worked K1B on 15 m SSB in under 30 seconds and two calls. To my embarrassment and shame, I was lazy and tried him from the house rather than driving down to the office where the Hex-Beam and big station are located. I used a FT-100D and the Titan vertical.

For penance, I will try to contact K1B using a FT-817 and a Miracle Whip (or if I get too frustrated with the Miracle Whip, I will use a 200 W light bulb for the antenna). As strong as K1B was tonight, I figure it might take a few more than two calls, but still doable. :-)

Actually, I bet that the FT-817 with our One BIG Punch speech processor hooked to the Hex-Beam can work K1B with ease.

73 de Barry - W4WB

p.s. I wasn't silly enough to spend $130 on the Miracle Whip, it is a loaner from a friend that did buy it. :-) I bought the light bulb.

703. Miracle Whip

Hi Barry,

America must be the land of opportunity if a guy can make a living making/selling Miracle Whip's for $130US a pop - checked out the web-site, and what a 'pile of tripe'.

If your going to use a light bulb, I would recommend a car headlight, as they would be directional due to the reflector at the back!

Hi David,

Oh, how right you are except the antenna comes from Canada. Believe it or not, QST published an article on this "antenna" last year. I called the editor and asked if they missed the April issue. :-) Good grief, they said they backed up his claims in the ARRL lab. Funny thing is that all he said is that you could work DX with no hard data.

Hmmm.... never tried a headlight. But then I would need a rotor. :-)

Oh yes, in England they (ML&S) are selling the Miracle Whip for £130!

Barry,

Apologies for the US/Canada mixed-up. If I'd known it was a Canadian design I wouldn't of been so harsh - afterall, they are our partners in the Commonwealth.

When I left England 130pounds would buy you about 70-80 pints of beer - a much wiser purchase I think!!

CUL

David

PS Worked K1B on 80M SSB on my home-made Miracle Whip!!

From: Herbert Meiselman
Topic: 707 Message: 707

Dear All:

I can only assume that the USA folks remember the old TV and print ads for "Miracle Whip" and are sickened by the thought. This product, made by Kraft Foods, was a low-cost (well, sort of low-cost) substitute for real mayonnaise. The ads and recipes suggested you use it in several ways, mostly to add flavor (?) to such items as Jello, tuna salad, cottage cheese, etc, etc. I grew up with the stuff, but gave it up when I discovered that salad was more than a wedge of iceberg lettuce...OK, for those of you not familiar with this delight, iceberg lettuce is like cabbage and usually served cut side up and covered with a thick dressing made from..you guessed it...Miracle Whip!

Worked Reunion Island on Sunday long path...the HB really has a nice F/B ratio.

NOTE: on Thursday morning, May 2, I will be heading for Barrow, Alaska to do so work with whale blood. A ham in the area (KA1NVZ) has agreed to let me drop by his QTH and try out some DX from north Alaska. Hopefully I can catch some of you, even without the benefit of a HB.

Regards and 73s,

Herb K6HJM

PS: auto headlight since it has a reflector...why not a bare bulb so it acts as a vertical? an isotropic radiator?

Warning: using headlights and other lightbulbs as antennas can result in significant non-harmonic radiation in the 600nm band, which can cause interference to other legitimate users of that band, some of which include airplanes, the military, ambulances and hospitals.

Also, radiation exposure in this and higher bands can be particularly harmful, and has been linked to skin cancer deaths. Many hams, particularly on Field Day, have willingly subjected themselves to dangerously high radiation exposure levels in this band while operating. I'm sure you can agree that the results of this sort of careless operating are not pretty. I personally seen victims with radiation burns covering significant portions of the head, neck and arms.

While access to the 600nm band is currently unlicensed and unregulated, it is better to err on the side of caution, in accordance with good amateur practice. Nuff said.

Topic: 707 Message: 710

Hi Herb,

Hope you have a FB trip and return safely. Drop one of us an email or make a post when you might be on-the-air from way up North.

Wonder is the Miracle Whip antenna is made with "Kraftsmanship?"

Of course the bare light bulb makes an isotropic radiator (more or less), the the headlight David suggested makes a beam antenna.

Oh yes, we have a FB storm a hundred miles or so to the west that helped the propagation on 10 m to the K1B this afternoon. 10 m is a bummer from here to K1B based upon prediction codes. There he was and three calls later he was in the log. Two bands down and more to go. :-) This time it was with the HEx-Beam, FT-1000MP, and the VL-1000.

There is only so much that can be discussed about an 'over the counter antenna', and with the exception of comparing balun types or installation etc etc, (which have both been discussed at length), there isn't really a lot to talk about, except the homebrewers amongst us. That is of course, unless some of you guys are willing to start modifying and experimenting with your expensive systems (which I doubt few are willing to do).

Regards all

716. Technical vs. non-technical

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-04 10:42:25 UTC
From: Buzz & Quinta
Topic: 716 Message: 716

I guess everyone is allowed their opinion. I would never "flame" someone for voicing theirs.
As a non-technical owner of a HB 5 bander, I really enjoy the humor that is put forth on this
board. If all I wanted was technical stuff, I would stay at work longer. For me, opening the
HB mail is generally "fun reading". If it is something too technical for these brain cells, I simply
hit the delete key.
I was not going to respond to any of the recent posts where folks stated they would not be in
the group any longer if it did not become a technical depository. I could say the same thing
180 degree around the circle, but I find it much easier to just delete the posts I don't want to
read in their entirety.
As for me, I look forward to some playful banter, and I even pick up useful information here, as well.

Happy Hexing,

Buzz
N5FTR

717. Hex-beam Chit-Chat

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-03 10:57:45 UTC
From: on6ec
Topic: 717 Message: 717

Hi Guy's
Not sure if I'm a new member because I read all the messages from the start of this reflector.
My modest opinion is that One can only say that much about one topic. So some humor is in place. However, when You buy a commercial Hexbeam system, which is not cheap, to European standards,(considering import tax and 21% sales tax in Belgium) and it works okay, the investment is maybe justified. But after testing the antenna, to find out if it is true, what the manufacturer claims, end of story.
It does'nt make sense to start experimenting and changing an antenna, already tested properly by the manufacturer and maybe turn it into a bad investment.
So the most interesting (technical) subjects will come from the people that build their own Hexbeams. One of the big questions I could pose is about the feed system. The commercial Hexbeam is fed with one coax and this does'nt seem to work very well with the home made beam.
I don't think that there is a lot of space in the PVC pipe, where the interconnections run through, to use coils or capacitors.
I had a home made 2 element quad and with the one coax feed system, 3 gamma match systems (one per loop) and compensating system (for reactance) it was a tuners nightmare. Tune one band, so detuning the other bands. After building a relay box and individual feedlines, no problem.
The other question is ; Why is the commercial Hexbeam fed on top and not at the bottom, a method which would make more sense to Me.
Well, that is it for now. keep up the good work.
Ed, ON6EC

From: David Douglass
Topic: 717 Message: 718

Hi Ed,

I was only joking about modifying the Hex Antenna (apologies but my rather poor attempts at humour don't translate well out of English). If I had spent a couple of thousand $$, I don't think I would be playing about with it either.

As for feeding the Hex, I think an interesting trial would be to try 70/75ohm twin feeder, as this is much closer to the desired feed point impedance than other twin lines, which I believe is inside the HB5. As for feeding it at the bottom, this also makes more sense to me, although it would be a bit more tricky to engineer/make them that way I would think. It would be interesting to find out, but I would think the initial HB% was designed this way because it was easier to build like that?? - Please feel free to correct me if I'm wrong guy's!!

Finally, my final word on the technical content of posts on this reflector - "If you don't like it start posting something more technical and get some discussion going".

Regards - David, VK2DPD

PS came across a very interesting antenna on the "GAP" website today. Can't remember the link, but it's called a SuperC. If anyone knows anything about these I'd be interested to hear from you, as I wouldn't mind having a go at an 80M version. It would be also good to keep my Pigeons in (you'll see what I mean if you check it out)

But after testing the antenna, to find out if it is true, what the manufacturer claims, end of story.
It does'nt make sense to start experimenting and changing an antenna, already tested properly by the manufacturer and maybe turn it into a bad investment.
So the most interesting (technical) subjects will come from the people that build their own Hexbeams. One of the big questions I could pose is about the feed system. The commercial Hexbeam is fed with one coax and this does'nt seem to work very well with the home made beam.

I don't think that there is a lot of space in the PVC pipe, where the interconnections run through, to use coils or capacitors.
I had a home made 2 element quad and with the one coax feed system, 3 gamma match systems (one per loop) and compensating system (for reactance) it was a tuners nightmare. Tune one band, so detuning the other bands. After building a relay box and individual feedlines, no problem.
The other question is ; Why is the commercial Hexbeam fed on top and not at the bottom, a method which would make more sense to Me.
Well, that is it for now. keep up the good work.
Ed, ON6EC

Topic: 711 Message: 719

Hi Hal and Eric,

First, let me point out that I'm the owner of this reflector and, frankly, it has the "flavor" that I had hoped it would take on.

David and others have correctly pointed out that there is only so much you can say about the commerical Hex-Beam; however, all has not been said yet. The primary purpose of this reflector was, and continues to be, a place where folks who are Hex-Beam owners or are interested in this antenna form can meet, discuss, help each other, and make new friends. With just a few hundred Hex-Beams in the world, how each would you easily find another Hex-Beam user to discuss HB matters with?

I am the moderator of several other lists with one having over 3000 members discussing just the FT-817. The flavor of it is rather different. If you look at the photographs, read the extensive and useful material in the files, and read past postings in the archive, I believe you will find significant technical information. I am sure several folks would have been unhappy with their antenna had it not been for the contacts made on this reflector that resulted in solving their particular problem(s). This is in the ham spirit isn't it? Making friends, helping others, and enjoying the hobby are certainly important to me.

If you have technical questions or contributions, please ask/post them. Just remember, this reflector simple serves as a gathering place for those interested in the Hex-Beam. An interestingly large number of people have or are attempting to build their own Hex-Beams. They and owners of the commercial version of the HB have shared information and learned from each other.

I hope you will stay and participate, but if this "relaxed" group is not what you are looking for, I sincerely hope you find it elsewhere.

Eric, hope you have great pleasure with the HX-5Bi you have coming!

From: w4wb
Topic: 720 Message: 720

Hello,
I hope this message will find it's way. I'm new to the group and not familiar with spotting to newsgroups. I'm DL7IO and I have build a couple of 5-band reflected W beams or HEXBEAMS if it is Traffies version by myself. I mostly used the low impedance feeding line the commercial Traffie version has. Right now I'm testing with a direct coax-feeding. Mathematics are done and I will be ready for practical tests/field measurments next week.
regards Holger

721. Is your HEX Beam cracked up?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-03 14:20:25 UTC
From: Peter D. Vouvounas
Topic: 711 Message: 721

My fellow HEX friends,

After a few months following my 5B HEX initial erection I noticed that the fiberglass spreaders have a crack at the 90 degree point when viewing from the base plate.

The termination of the spreaders with U-bolts compressing metal angular sections have deformed the ends such that the fiberglass surface has started to take on a 90 degree angle.

I don't believe that any serious integrity issue will surface but surly want to keep an eye on the situation. A little tough to view this area now that the antenna has been crained into it's final position. (HEX has been elevated approx. 11 months.

Please share any observations you may have.

724. homebrew MKII Update

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-04 14:04:18 UTC
From: David Douglass
Topic: 724 Message: 724

Hi Guys,

Just a quick update on the performance findings of the MKII Hex (Individual Feed System).

In comparison to the MKI, multi-fed Hex I can pretty much say the following.

1. Individual feed lines definitely make SWR adjustments easier.

2. Interactions between elements seem high in both antennas, but much more so in the multi-fed antenna (don't expect to achieve good SWR on all bands in the multi-feed system, unless you want to buy the HX-5Bi). Thankfully a good SWR doesn't mean squat when it comes to performance!

3. Performance seems good on all bands, as opposed to poor performance on 15M on the multi-fed antenna. Performance on 20/17 and 12 were pretty much the same, and it was hard to tell with 10M due to variation in propagation. FB ratio on 15/10 metres on the MKI seemed poor!

4. Multi-fed antenna had the added bonus of good performance on 30M (with a external tuner - my TS570 internal tuner would not handle this). 30M performance on the individual fed antenna was very poor in comparison. I assume this is due to the multi-fed antenna simply having a lot more wire connected to the feed line.

Obviously these conclusions are just based on my general observations, as I didn't run both antennas at the same time, although I think I did get a pretty good feel for the performance.

Final tally was << MKI = 12 new DXCC....MKII = 2 new DXCC >>

In conclusion, if and when I make a MKIII antenna (too bloody cold at the moment), I think I would have another go at multi-feeding (possibly using twin-feed all the way to the shack), although I would want a different antenna mast to allow quicker and easier lowering for adjustments.

Good night all

David, VK2DPD

PS just worked K1B on 30M - to give 9 bands CW (160-10)

From: dl7io
Topic: 725 Message: 725

Hello everybody,
I'm Holger, DL7IO, and this lokes like my first succesful posting hi.
Thanks to W4WB for QSP.
I bought about 2 years ago 3 HEX-beams from Traffie. But my beam (HX5B # 034)was lost during the flight back to Germany. This was no problem of Traffie (he delivered within the states) but nevertheless we did not come together and I finally made my first beam by myself.
I used the same feeding systems he is doing (low impedance line parallel feeding of all elements).
The antenna itself is based on a reflected M design or also described as X-beam in some literature. Multiband versions are difficult to design because of the strong impact/influence between the wire elements.
There are 2 designs for monoband beams.
1.) Best gain with 25 Ohm feeding point. So easy to match to 50 Ohm by a quarter wavelength coax stub(37 Ohm or 2 x 75 Ohm parallel). Bandwith is very small.
2.) 50 Ohm design with less gain but more bandwith.

I've done lots of modelling and mathematics and prepared a version that is hopefully more easy to build with 50 Ohm coax feeding between the driven elements.

I've everything I need for measuring antennas and next weekend I will make field tests with various types of those beams. I hope we also can get a HEXBEAM made by Traffie to compare all beams.

During the last year I made about 20.000 Q's from DXpeditions and during contests with my reflected W's and I found lot's of interest by other HAM's.

After finishing my field tests I will deside for the version I will use for building a small serie of 10-20 5-band beam.

I did not read all the postings but I got the feeling that the homemade versions use singleband coax feeding. Has anybody made the feeding with a single coax cable?

By the way,once sitting in a very "interesting" meeting I used the timeto make a powerpoint file with dimensions, fotos, all details needed to build a reflected W beam. Any interest?
regards Holger

Hi all,

I've just uploaded a file to the Files section. This is a PowerPoint file from Holger - DL7IO, which I believe details some of his homebrew work with the Hex (ReflectedW).

I haven't had a chance to view the file myself, as I don't have PowerPoint on my PC, and I will have to wait till I get to work tomorrow to have a look (Much better than actually doing any work).

If anyone has any problems with the file, I can probably directly e-mail you a copy.

Hi all,

For those who haven't checked it out yet, Holgers file is a must see, especially for those planning on making there own antenna. There are some excellent design tips in there, as well as comprehensive measurements and dimensions.

Holger, I'd be interested to know what sort of SWR data you have on this, and whether you have done any measurements of gain/FB ratio.

An excellent Job - well done!

Thanks for the flowers David.
So it finally was a good decision to take part on the meeting 'hi'.

I've done everything you are asking for. The SWR is less than 1:1,5 on all bands (it is better in reality than on my computer modelling!). The gain is the best on the CW-portion of the band (varies between 6 dBi and 5 dBi) and goes down to about 3 dBi. 10/12 m has less gain of about 4 dBi max!!! By changing the element design you can get 1 band better but the other one will lose gain to for example 5 dbi on 10m and 2 dBi for 12m. The wires are to close together and are influencing each other very strong.
This can be confirmed by feedback from users even my impression was a good gain on 20/17/15 but especially on 10m most other stations got out better than me. But on 10m many HAMs have more than 2 elements...

I'm going to do measurments for gain, F/B and SWR next weekend and will compare a couple of versions. I hope to get an original beam from Traffie to compare with my versions.

Next week if I complete my paperwork I will give you the results.

From: on6ec
Topic: 730 Message: 730

Hi Holger
Looked at your Hexbeam PPT. Very clear explanation. Well done.
About the wires being close together for a multi-band design. It was the same with my home made two element quad for 10/15 and 20.
With all the loops in place and mounted on the carriage system against my freestanding tower, I only had to push one driven loop a cm or so closer to the one next to it, and the reactance changed.
BTW, I also observed a change in reactance, cranking the antenna to operating position at 20 mtr and measuring every meter with a electrically neutral length of coax connected to the beam and the impedance/reactance analyzer.
Keep up the good work.
Regards Ed ON6EC

732. spreader materials

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-06 15:44:03 UTC
From: dl7io
Topic: 732 Message: 732

Hello Peter,
for the first beams I used fiberglas fishing tube of about 4 m length and took of the small top element. It is seen in the .ppt file.
The bottom (where it is clamped to the mounting plate)was filled with wooden sticks (30 cm)to make it strong enough for the U-bolts.
Now I'm using fiberglas tubes made on my special requirments. This fiberglas is winded!!! This makes it much stronger than in the length stretched fiberglas. That means it can be thinner. The end and the connection between the 2 parts are thicker made so I can use directly U-bolts to connect it to the mounting plate. At the bottom the diameter is 20mm and on top the diameter is 8mm. The weight of all tubes is about 2.5kg. The whole antenna has about 7-8kg.
My tubes now are black, UV-resistant and also the centersupport is from fiberglas.
This fiberglas is the most expensive part from the antenna! The prototype tubes costs about 300 Euro. But I ordered only for 1 antenna.

With fishing tubes it is of course much cheaper (about 200 Euro for the whole antenna).
I had sometimes Force12 winds on Malta with my fishing tube beams and they withstand without any problems.

The wooden centersupport seen in the.ppt file was only for experiments. So I had the feeding systems outside and could easier do some changes.
regards Holger
PS. Will add a .zip file with fotos

734. Linear Traps

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-07 01:07:46 UTC
From: vk2dpd
Topic: 734 Message: 734

Hi All,

There has been a bit of talk about the way in which the elements interact in the multi-band Hex antennas. As all will know, this makes tuning difficult and tends to minimise band width.

I have posted a picture in my Photo-Folder, showing a proposed system to minimise this.

I take no credit for this, and it comes from Les Moxon - G6XN - HF Antennas for all locations. I have not tried this out, but this guy knows antennas, I would recommend this book to anyone mildly interested in Antennas (knocks spots off the ARRL Antenna Book).

The photo is called linear trap, and this is an easy mode that could even be done to the HX-5i (I can just imagine you guys breaking out into a cold sweat at the thought of modifications)

Regards all

David, VK2DPD

Final tally K1B - 9 bands CW, 7 bands SSB, 3 bands RTTY all homebrew antennas

Peter,
I used fishing pipes of 4m length for experimenting. Costs are about 8 Euro each in the shop or 3 Euro if you byu 100 pieces at the manufacturer/Importer (Netherland has a few). But they are only 0,6 mm thick or better thin and the fiberglas is stretched in the length. So they are very soft and can break easy. I have no idea how they will work with ice. Wind is no problem for them. But you must support them in the mounting plate area. I used 30cm wooden sticks to put inside otherwise the clamps will break the fiberglas.

I'm now using fiberglas rods made on my special requirements. This is winded and thicker. The lower 30 cm of the rods are double that thick like the rest (2-2.5 mm fiberglas). The diameter at the bottom also is smaller. It is 20 mm outer diameter and about 8 mm at the top.

I've not made fotos yet from the prototype but will do this during the measurements next weekend. I got some people interested in and we will make a small serie of 10-20 beams after finding the best design. That means I will order more rods and hope to get a better price than. Right now I payed almost 300 Euro only for the fiberglas. The company is Germany based and can be found int he internet (www.cg-tec.de also in english!). They are deliverer for other antenna making companies and were very used to the themes.

By the way we are combining the measurements with a small IOTA activity. From Wednesday(night) till Sunday we are on Poel Isl (EU098) and will use a clubcall DF0RR/p or DF0RU/p for radioing. This also will count for HXCC ;-)

I will have 3 portable towers, 3 different reflected W Beams (10-20m) and probably also a Hexbeam made by Traffie.
...and of course some radios plus 'legal' power, computers etc. etc.
My Van will be full off stuff.
regards Holger

Peter,
you better use copper wire and no steel!!!!!
using steel will bring losses of about 1.5-2 dB. That means you are
almost like a dipole concerning the gain. Again please use flexible
copper wire! 1,5 mm² is a good choise. The best is nonisolated.
There
is a paint spray especially for saltwater protection available. Use
this for the wires.
If you use isolated wire, all elements have to be 10-15 cm shorter
than in my table.

By the way...SUPERGAIN.... If I read those slogans I would like to
cry. This antenna is a 2 element yagi with a different mechanical
design. It is a "compromise antenna" and has less gain than a 2
element yagi!!! So if someone compares it to a 3 element yagi and
will get better results with the reflected W than the 3 ele yagi does
not work properly!

The receiving impression is mostly very good compared to verticals,
dipoles or small yagis. The reason for this is that the elements of
this antenna are coupling with the magnetic field component. So you
have less noise more like a closed loop. This will be confirmed by
the changing of the feedpoint resistance while changing the height.
If you move up a yagi or other beam with much space between the
elements, the (50 Ohm or whatever) resonant frequency goes up higher.
With the reflected W it comes down. So if it has good SWR at 14.1MHz
and 4m the best SWR in 20m height may be at 14 MHz or 13.9 MHz. So
please remember this if you are tuning the wires.
regards Holger
PS. For the Math I used NecWin and EZNEC
I tried a version with one common feeding point far all band elements
but gave up without success.

Hello again,
coax feeding on top:
The low impedance line will not work this way if you feed from the bottom. This version has to be feeded from the top end.

Coax not in the middle of the driven elements:
1. the only position without (better with the smallest) impact on the radiation is on the side between driven elements and reflector
2. the feeding point is the current maximum
Holger

Well guys, I am a busy fellow and don't have the time to build my own beam. Seems like Traffie spent a lot of time figuring out how to make a 5-band Hex-Beam work correctly. He may hold the World's record for climbing up and down the tower for maybe a year while this antenna was under development. He clearly succeeded while no one else has come close based upon all of the homebrew reports.

Bless each and every one building their own version of the Hex-Beam. I'm sure it is great fun and a FB learning experience. Modeling doesn't yet correlate well with observations and there are reasons for that too.

For my part, I am happy to have paid Traffie for an excellent antenna and to reap the benefits of his over a decade of experience with this antenna form.

found this one in the latest OPDX. might be interesting for another HXCC...

CY9, ST. PAUL ISLAND
Operators Duane/WV2B, William/VE1AAO, James/VE9DH, Ed/W0SD, Arliss/W7XU, Holly/N0QJM and Edith/W0OE are expected to be on the air from here late June 29th through July 8th. The operation will feature two full time stations and an attempt is being made to add a third, part time HF station to be used during peak propagation times, especially to the Pacific area where CY9 is needed by many. The group plans on operating on the west side of the island to have a clear shot to Asia, South America, North America and most of Europe. The landing is much more difficult on this side because of the prevailing winds which always seem to blow on St. Paul with high seas; therefore, the start up date is subject to landing conditions. As far as it is known, no previous operations have been from this side of the island. This operation will feature a full time, dedicated six meter station operated by W7XU, N0QJM, W0SD and W0OE. The six meter station WILL ONLY transmit on 50.157 MHz listening up when there is propagation. A beam and ACOM 1000 amplifier will be used with operation on SSB and CW. Liaison will be available on 28.886 MHz and E-mail updates via WINLINK 2000 will be provided to the appropriate Six Meter Internet sites. The Grid Square will be FN97. A special effort will be made to work Europe on double hop sporadic E in addition to North America and Caribbean areas! A second station will be set up for HF. The operation plans to use a 5 BAND HEX BEAM FOR 20-10 meters and a vertical on 30 and 40 meters. Given the time of the year, no operation is planned for 80 and 160 meters. An ACOM 1000 amplifier will be used. There will be activity on RTTY, SSB and CW. Operators will be WV2B, VE1AAO, VE9DH, W0SD, W7XU, N0QJM and W0OE. Planned frequencies are as follows:
RTTY - 7080, 10115, 14080, 18080, 21080, 24908 and 28080 kHz
CW - 7005, 10105, 14020, 18100, 21020, 24900 and 28020 khz
SSB - 14195, 18145, 21295, 24945 and 28495 (alternate 14145) kHz
All QSLs via W7XU.

p.s. K1B also in the log here. unfortunately, the hexbeam isn't up yet, so had to do it with an indoor wire dipole.
more remarks about the hexbeam (the 15/10 dualband version with 6 home-added) later.
greetings, Peter.

Here is a little communication I had with probably the most famous
Hex-beam user, Chuck Brady, N4BQW/3Y0C.

73 - Doug - W6HB

****

Thanks Doug , Wish we could have got you from Bouvet....I am not an
antenna
expert, but consistently all the places I have ever been around the
world,
Mike and other fellows with hexbeams are a couple of s units louder
than
others in their area.....often times Mike was the only stateside
station on
some days I could hear on Bouvet including friends with high
multielement
beams and quads-----it is also just a superb Dxing
antenna ,lightweight
,easy to set up....we are going to submit an article soon on 3y0C and
hope
CQ or QST will run it. Best 73's Chuck

Hi Barry and All,

And Thanks for the comments on linear Traps!

Firstly, obviously the word 'trap' has gotten a few people confused'. This is not the type of trap you would find in your average multi-band vertical or commercial tri-bander, but a small device for the "suppression of currents induced from neighbouring elements", which, if we like it or not, tends to be a fact of life in closed spaced arrays. From what I can gather (and I'm no expert), this is the only role the device plays, and should have no other impact on performance.

As for increasing weight of the antenna, this shouldn't be a problem as all you are adding is a few metres of wire and some small lightweight caps of negligible weight. Who knows, if Mike Traffie had tried these in his initial design maybe he could of saved a lot of climbing up his tower?

Whilst I partially agree with Barry (for a change), regarding the performance of the HX-5 against our meagre efforts, I tend to think maybe the performance difference is not so great, and I would be happy to compare DX logs with anyone.

Finally, and with the hope of not upsetting anyone further (not me, I wouldn't do that, "honest"), I agree that all of our times are valuable and it is difficult to find time to experiment and build stuff (I have a full time job and 2 kids under 5). However, on the other-hand, experimentation has always been a big part of our hobby, and one that can be, and is, very rewarding. I realise that some of the posts/comments I may have made, make it sound like I'm having a 'go' at the Hex-Beam design, but I appreciate (probably more than most as I've done a little myself), how much effort has gone into making this antenna, and a damn fine antenna it is, considering it's size.

Have a good weekend all, from sunny NSW

Spring special price is $889. Costs money to build a quality product like the HX-5Bi, provide user support, attend hamfests like Dayton, etc. And they even to make a little profit, right? Look at the overall investment as well, i.e., tower/mast and rotor. You should be able to have the HX-5Bi up and running for under $1100.

I don't think there's any excuse for just observing, when they're is fairly detailed instructions on the site as to how to build your own. I can't speak for the price of components in the US, but what I've seen of the fibreglass tubing I would be surprised if it should cost you more than $100 and a weekends work. As well as making a very fine antenna, you will also have the added bonus of being able to tell the DX you made it yourself. I find that's usually worth a couple of S-Points at least.

It's not just the Hex-Beam, but most commercially made antennas are very expensive, when you consider the cost of the raw materials!! I've seen people trying to sell wire dipoles for a couple of hundred bucks!!

Regards

750. De-tuning . . . .

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-12 15:42:56 UTC
From: g4mjw
Topic: 750 Message: 750

Hi All,

A while ago a made a 15 mtr Mono-band HexBeam. I used GRP fishing rods and flexweave for the elements. On my 12ft high setup pole it was easy to fine-tune the lengths and gap between the tips to achieve 1.2:1 SWR at 21.25ØMHz. I took my FT-84Ø /PSU/SWR meter out into the garden along side the antenna. Listening to DX I was able to "swing" the HexBeam straight at the station and then swing 180 degrees off the back of the beam. There was a nice drop of at least 2-3 S-Points off the back of the beam. Even at 12ft above the ground, most signals were about an S-Point or so up on my Dipole. So it seems to be working OK.

Having shuvved it up on my mast at around 4Øft AGL all signals are still at least a S-Point up on my dipole which is now much lover than the HexBeam BUT I have lost my F/B . . . it does not matter which way I now point the HexBeam, signals are all more or less the same signal strength. (there are some minor nulls and peaks as I turn the rotator.

Obviously a major "de-tuning" affect. However, the SWR is still very low ~ 1.2:1 to 1.3:1 across the band. I guess I need to re-adjust the gaps between the two elements. Anyone know which way it should go??? I can't do it up on the main mast . . . the gaps are too far out to reach!

Any help will be most welcome.

Bye for now ☐ Steve/G4MJW

Hi Steve,

I didn't try 12', but at about 8' on the HX-5B, the resonance was about 300 kHz or so low. When it was raised to height, it was right on the money.

For a 15' beam, you might want to think about using it at about 29' rather than 40'. The pattern will be a bit nicer for general applications I believe.

Congratulations on a nice job getting the antenna to work.

Thanks for the info Barry.

I've wound it up-and-down while in contact . . . . from 20ft to 40ft
and can't say that I really notice a lot of difference!

Emmmm, maybe I'll put it back on the 12ft mast and use it like
that . . . thus restoring a good F/B ratio!

Thanks for yr help - Steve/G4MJW

I don't want to pick any fights and I've never even met Mike Traffie (although I hope to in Dayton) so I have no axe to grind but I do think he developed and now sells a very interesting and high performing antenna. How many hundreds (thousands?) of hours did he spend in development work before he even got close to selling the first one? And how many hours does it take to hand make the parts for each one? And how much does it cost to advertise it and promote it? In short, I'd be very surprised to learn that Mike has made the price of a not that fancy car out of the whole enterprise, so suggesting he is somehow profiteering doesn't make sense to me. If there is the ability to homebrew--as DD puts it, "fairly detailed instructions on the site"--it is there for one reason and one reason only: because Mike spent a lot of time and effort developing and implementing what is a very complex technical challenge, particularly insofar as the the 5 band antenna is concerned. I should think the homebrewers (whom I take my hat off to) should thank him, not begrudge him a price that enables him to justify the effort. Indeed, I should think the homebrewers, with much more first hand knowledge of some of the complexities involved, would be the last to compare developing the 5 band Hexbeam to selling a dipole. 73, Bob, K2WY

Hi Gang,

Dayton is only a few days away now. Several weeks ago several of us discussed getting together on Friday at 11 AM in the "dining" area of Hara arena. I agreed to keep track of those planning on attending. Not many so far have responded, but here is the list

K?FUZ John
K?TRL Brad
W4WB Barry
N?YD Tom
WB3FSR Peter

If anyone else will be there, please let us know. Hope to meet you all in person.

Bob,

I totally agree! Without the work of Mike Traffie I wouldn't of even thought of attempting to make a Hex-Beam, or would have had any idea where to start. This is also the case of my previous antenna, for which I'm indebted to Les Moxon, and the one before that for which "I take my hat off to" the late Louis Varney. All of these people have spent countless hours in amateur experimentation, for the sole reward of sharing there efforts with people like us.

As for begrudging Mike the cost of the antenna, I sincerely hope I haven't implied that. If you compare the Hex with other antennas on the market, and see what you get for your money, it probably doesn't look so expensive, and I don't think many people would argue that the Hex is probably the best 'small' beam commercially available. However, $800plus is a fair whack of money, and out of the reach of many!

Finally, as for dipoles v hexbeams! We all know that the 5 band Hex is 5 stacked dipoles, so if dipoles cost $200 each, your saving a couple of hundred bucks and getting free reflectors thrown in to boot!!

Wishes to all

David, VK2DPD

Plagiarism is one of the greatest compliments.

Its a good day - just received my Hexbeam (HX-5Bi). Only out of curiosity really, why isn't the hub pre-drilled with the thru-bolt hole? Without a vice to hold the centre plate, at the moment it seems an onerous task for the owner to carry out.

Eric G0CGL.

Eric:

I'm sure you will get 1,000 replies to your question below, so excuse this # 1,001.

A thought...do you have the hub upside down? My HX-5Bi does have a through hole for the support mast bolt but not for the plastic "pipe" which is for the center of the antenna. The support mast part of the hub also has two set screws for attaching the hub to the support mast.

When properly orientated, the round part of the "U" bolts for the 6 arms are on the top of the hub and the threaded parts of these "U" bolts face toward the support mast.

73s,

Herb K6HJM

Hi Doug and Herb

I'm seriously confused and concerned (no fault of yours, believe me I'm grateful for your help).

I'd be pleased to get your further claification before I approach Mike with the problem (which is not easy from the UK).

My understanding is this: my centre plate is upright when the round parts of the U-bolts are on top. The hub is for the feed column and has a black mark on it to align with a similar mark on the column. It has 2 allen screws only.

the underside has the U bolt nuts and the hub takes the water pipe stub mast It has 2 allen screws but it does not have a thru bolt hole.

I guess from you kind folks are saying is that is should be pre-drilled?

Eric.

Eric,

I called Mike. He will be calling you. Hopefully he can reach you since they are heading out to Dayton shortly as well.

He doesn't put the hole in anymore. Folks with solid mast and other certain masts have had a hard time matching up holes. As I gather from him, it is wiser to drill the hole through the base plate and the mast you are planning to use at the same time so that the bolt will easily pass through. As I recall, I had to oversize the hole in my mast a little to get it to match up.

Hope this helps explain a bit, but am sure Mike will clear it up even more given that he can reach you. How about that for first-class customer service! He was there to answer questions for me when I was getting ready to put up my HX-5B.

Let us know how it performs after you have had a bit of play time with it.

73 de Barry - W4WB

Eric...

Now I am confused (my usual state!) since the hub should have been drilled for a through bolt for the support mast/pipe. Mine was, so I only had to drill the pipe that I use as the mast.

Maybe the problem is USA vs. UK "standards"...you guys drive on the wrong side of the road, drink the "real ales" somewhat warm, and still have strange measurement units (e.g., Whitworth sizes, BWG for wire, etc). Maybe Mike Traffie was unsure about the nominal normal size for the hole (hi hi).

Sorry for all of this...guess you are just holeless!

73s,

Herb K6HJM

Thanks for all the replies and thank you especially Barry for calling Mike who did telephone me which is really excellent service. Well the hole isn't pre-drilled anymore, as you say, for understandable reasons. No problem, I ll get it done.

I have to first put up a lightweight mast, just acquired, get a rotator and so on. My present antenna is a GAP Titan vertical so I think I'm going to see a big improvement (though I think the Titan is good as verticals go). So it will be a while before the beam goes up but you can bet I'll want to let everyone know how its going when that day comes.

73 es tnx agn

Eric,

I called Mike. He will be calling you. Hopefully he can reach you since they are heading out to Dayton shortly as well.

He doesn't put the hole in anymore. Folks with solid mast and other certain masts have had a hard time matching up holes. As I gather from him, it is wiser to drill the hole through the base plate and the mast you are planning to use at the same time so that the bolt will easily pass through. As I recall, I had to oversize the hole in my mast a little to get it to match up.

Hope this helps explain a bit, but am sure Mike will clear it up even more given that he can reach you. How about that for first-class customer service! He was there to answer questions for me when I was getting ready to put up my HX-5B.

Let us know how it performs after you have had a bit of play time with it.

73 de Barry - W4WB

FB Eric. I also have a Titan and like it a lot. However, I hope your experience is the same as mine. The HX-5B just blew the Titan away!

Well it hasn't been cheap for me: the hexbeam price + shipping to UK + customs duty = a lot of money.

BUT... my first choice was Hexbeam which I ordered from a UK company who were distributors but stopped being so just as I was placing the order. So my next move was to thoroughly research alternative antennas: Cushcraft MA5B Force 12 C-3SS, Optibeam 6-3M, Cubex 2 ele quad, SteppIR 2 ele yagi, TGM 2 ele mini-quad. I was resigned to having one of those and not a hexbeam.

In most cases I sought out manufacturers' specs, reviews and owner testimonals (I found UK owners of the MA5B, Force 12 and Cubex quad). I could not select any from that list above. My own personal reasons were (in same order as above): lack of performance on 17/12, ditto, too big, complicated feeding, too big, previous bad experience of similar hybrid quad (though in fairness, owner testimonials on eHam.net are very good for the TGM).

Hexbeam: good performance all bands, good size for small plots, lightweight hence able to save on mast/rotator. And as I have found out both prior to and since ordering, excellent service. Mike phoned me twice prior to the order and once since. Plus all the help you would ever need is right here with you guys. Worth every cent? Definitely.

772. Hex beam owner Dayton get together

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-15 20:45:23 UTC
From: k0trl
Topic: 772 Message: 772

I talked to Mike Traffie and he has agreed to put a sign in his booth announcing the get together at 11AM on Friday in the food concession area. As I remember from last year there are several tables as you go up the ramp to the east of the arena. Anyway, check the map at the Hexbeam booth and see y'all at 11 on Friday. Thundershowers are forcast so it may be a really good time to be inside.

73 and looking forward to meeting you all

Brad KØTRL

773. no success.... but great promotion

Topic: 773 Message: 773

Hello @ll,
after beeing silent for a while I would like to give a few words to my last weekends tests. Sorry for delay but I am one of those poor guys who has to work for a handful other mouthes waiting at home....

Nevertheless I meanwhile did manage to read all the messages.

Where to start?
30/40 m operations... The modelling shows some gain (about 3 dBi, free space) but the feedpoint resistance is far from 50 Ohm. No real F/B less than 1 dB but good F/S. So if you have enough coax cable it is possible to tune the antenna. Even I made some QSO's on 30/40 but my HF-9V had about 1-2 S units better signals (same cable, 6 m distance, vertical on earth).

But back to the tests I did like to make.
Date and place were decided because we were about 20 people staying for a long weekend on Poel Isl. at the Baltic Sea cost. So I had enough helping hands to prepare everything.

I finally had 3 beams HX-5B #046 from late DL7VRO (rest in peace). My homebrew RW5P #0 which is very similiar to the Traffie beam and a new design RW5C #0. This is also a 5-band version but with a coax cable for feeding the band DE's and of course other dimensions for the elements.

2 things were on my plan:
1. check out the new design
2. gain measurements between the antennas

Since I'm working on different designs since about 1,5 years now all my friends (HAM or not) knows much about this kind of antenna. But not many had seen soemthing like this. So we had lots of interest from everybody about the mystery antenna...

The very bad news after arriving was, that my SWR meter was mechanically destroyed. So we had to use transceiver meters...

The antenna to measure was about 9m (30 ft) high. We had to rotate by hand(no rotor). The measuring antennas were a 2x2m dipole also on 9m high tower about 60m away and G5RV same height 80 m away. For measuring I used a selective millivolt meter for the 1-30 MHz frequency range.

The interesting thing and same with all antennas was: best gain at about 30 degree both directions and not at 0 degree!
We can't say anything about gain compared to a dipole. We only have

the differences between the antennas.

The differences are mostly between 1-2 dB which I would not take for absolute because we had nice wind and the antennas had some chance to move in the take off position.

The RW5C is sometimes hard to compare because it was out of band on 20m (14.65 best SWR) and 12/10m (25/27.75 MHz) with in those bands the SWR was not usable (1:3-15). With 50 m coax (H100, which is not bad and like RG213) no antenna tuner was needed! The old story...

For 12/10m the gain gets bigger at band end. This is in fact not correct. The absolute gain gets down as higher the frequency comes (see 20-17m). This will be an impact of the measuring dipole (2x2m) as we come closer to his resonant frequency. So one can only value the differences between the curves.

A jpg-file with the results is in the file section under dl7io.

I will do some more measurements at a friends place and will compare with singel band dipole to find out the gain compared to dipole. Im not awaiting much gain on 10/12 m. There the antenna is not much better than a dipole. Not on modelling and not with receiving/transmitting impressions by me and others here around. If I read comments like playing like my 6 element on 10m I only can wonder...

Of course we made some photos but we use the old way and need to develope and scan them before I download them.
Nevertheless there is a QSL card with a homemade beam in the photo section. We had 2 of those on Malta last year (9H3O) and made about 11 kQSO's. I'm on the left side.

We also made a couple of hundreds QSO's (DF0RR/p) this time and I guess I worked JH1NHD on CW.

More to come later.
regards Holger

Holger,

Very interesting finding's and many thanks for posting the information. I think many people will be interested to see your gain figures, when you get the chance to compare the antennas with a dipole. Although I haven't had a good look, I have never been able to find any real gain data on the Hex, with the exception of some modelling.

I wonder if you plotted your data to get a picture of the radiation pattern, as I would be interested to see what the Front-Back and Front-Side ratio looked like and if there was much of a lobe at the back?? Prior to playing about with Hex-Beams I had made a few Moxon Rectangles, which have great F/B ratio, and I feel that the Hex is nowhere near as good in this area (although structurally it is far superior, and has a slightly smaller foot-print)

I've been trying to talk my wife into going to the bottom of the street with a RF meter and taking some readings but she'll have none of it!!!!!!!

I don't know what your feelings are but looking at your data, I would have to draw the conclusion, that in general terms there is very little difference, from the point of view of gain, between the 3 beams??

Again, many thanks to you and your friends for the work - TOP STUFF!!

David, VK2DPD

PS. If I had a rotator I would be programming in a 30° off-set, but I turn my antenna by hand and guess the bearing, so don't suppose it will mattrer much!!

Hi Holger,

The +/-30 degrees offset makes no sense to me. I can easily pinpoint a station with the heading dead-on the direction to the station and it is along the HX-5B axis of symmetry. I see a single maximum, not two spaced 60 degrees apart. And yes, I have played the game of having known stations send a carrier for me to map the pattern. I have noticed deep nulls about 30 degrees either side of the rearward, not forward, direction! That makes some sense too. My F/B on 20 m for instance is in the 18-25 dB range depending upon where I am in the band. I rather ponder what you are doing to have such results as you report. I look forward to your continued investigation.

Hi Barry and all!

Hope you fella's all had a good time at Dayton and didn't get too wet, as predicted.

As for this 30º off-set, I've been trying it out here, but can't really notice a big deal of difference over about 70º or so (which I suppose is pretty right for a 2 element beam), although as I have to get out the chair and turn my beam by hand, I suppose signals could of dropped or risen etc etc. Also the radio here only has one of those S-Meters with LCD bars, which are pretty hopeless, why they couldn't stick to the old sort is beyond me!!

If it is correct, it would be pretty much be the ideal antenna for me, as I could point SP NA and SA, and LP EU at the same time. It gets to be a pain after a while having to get out my seat to turn the beam, when I'm calling to Europe and I get answered by someone in the US!!

Barry, I heard they were selling FT-817's at Dayton for $500, any truth in the rumours??

Regards to all from the frozen South

779. Dayton - Hex-Beams, FT-817 & FT-897

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-20 12:58:13 UTC
From: w4wb
Topic: 773 Message: 779

Hi David & All,

Yes, Dayton was a blast and the WX was good for those outside all but Friday afternoon. Maybe 30,000 people again. The Hamvention station was using a Hex-Beam and Mike said his booth was busy too.

The wildness went on with the FT-817 this year too. GigaParts was the low-price seller in the US before the show at $564 with free shipping. At the show, Yaesu provided the dealers with a special Dayton-only coupon that quickly allowed the price to drop to $499 within the first hours. Truck loads of the 817s were brought to the show and were selling like hot cakes. I can assure you that the dealers were making no more than a few dollars gross profit at this point. The low point last year was $640. I got to see little of the show because of working our W4RT Electronics booth, which specializes in FT-817 accessories. We were thankfully busy the entire three days! Thanks to Yaesu, HRO, AES, etc. for making it possible to have even more folks wanting out toys for the 817.

The Ten-Tec Orion was shown and will be ready to sell in September. Scott of Ten-Tec said that this is a firm date, perhaps. :-) Looks better than prior big Ten-Tec radios and should be a FB radio. Software is being written now. Think I will wait a while on this one till the bugs are out.

The FT-897 was shown and is a killer portable radio. It is bigger than the FT-100D and smaller than the FT-847. It is a 100 W rig on AC or runs 20 W on battery. It can have two 4.7 Ah NiMH packs internally (or an AC supply). It will include the new 60 m band as well. Also covers the WX unlike the 817. Covers 160m to 70 cm (same capabilities for satellites as the 817 it appears now). It will start shipping in July here and price is TBD, but is expected to be $1000 to $1500. My guess is $1350. This will be my next rig I think. Oh yes, without batteries, it weighs 2.7 pounds I believe they said. For more info on this radio, see the Yahoo! Group FT897.

David, perhaps you can get your wife to handle the rotor matter for you. Hmmmm.... never mind. ;-)

Yes, it is about 4 degs C here this morning. Rather a record for this date.

If your near field observation showed "higher" apparent gain at 330
and 30 degrees vice 0 degrees, does that substantiate the fact that
the antenna seems to work much better on long haul than local work as
Traffie has seen? Are we seeing convergence on long haul that is not
apparent with modeling or on a test range?

782. Where did everybody go?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-20 20:54:16 UTC
From: Marty N5NW
Topic: 773 Message: 782

Saturday at Dayton was my introduction to the hex beam. Frankly, I didn't pay much attention until I got home and read the promotional literature. As I've just purchased a home, I began to look seriously at antennas. When I returned Sunday morning to ask some questions, lo and behold, the tables were empty! Guess the gang either had a very late night, or got an early start on the return trip.

Anyway, my questions might be better answered here. The literature discussed a bit about height and interference from other antennas. I plan on having an 80m dipole (off-center) that will be resonant on 40 as well, maybe a 30m dipole, and the 5B hex beam. I also have a dual-band VHF antenna (100"), along with a very small 2-m Squalo and 6m omni antenna to put on the tower. Ideally, I'd put the beam on top (at, say, 55 ft. or so) and have the dipole underneath at 50ft, with the dual band VHF Vertical and small VHF horizontal antennas around 40 ft.

Can someone help me out and describe how this would affect operation of the beam? I know the recommended height is much lower (35-40ft), but if the beam is on top (and with the rotor, it would need to be), that would place the other antennas much too low, in my opinion.

Thanks for the feedback.

Hi Marty,

The Hex-Beam team had a problem with the mtor home that required them to leave early in order to meet other requirements. I heard that it was a massive brake problem. In any case, I was told that Traffie hated to leave early.

There are ways to mount the Hex-Beam lower on a tall tower. Call Mike and talk to him. IMO, you really want to have the antenna at 35-40'.

Hello again,

same to me Barry. I have no idea why this happens. First we did not
take care of other directions but I wanted to make a 360° diagram
for
the gain to see F/B and F/S ratio and there we found that fact. We
changed back the other beams to the tower and got this confirmed. We
are talking about a small value that I'm sure you will not measure
with a far away test. But doing it with an selective millivolt meter
you can see changes of parts of an dB.
Even the modelling does not show this. Because we did not use a balun
i thought it may be only to one side (symetric/unsymetric) but we
found it to both sides.
Give me some days to prepare the 360° view.

As I did not take care on my girls that weekend I had to promise them
a "family only" weekend and we made a 3 days bycicle tour the last
weekend. That's why the late answer on your comments. But I guess you
also were busy with Dayton.

785. Dayton and the Congo

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-22 01:29:07 UTC
From: tomac14
Topic: 785 Message: 785

Hello to all:

Dayton 2002 was great. I met Mike Traffie, Barry Johnson (W4WB), Barry Baker (K0QV) and several other Hexbeamers at Dayton.

I spotted Mike Traffie climbing up the tower outside of the trailer to visit his hexbeam. Apparently Mike makes "house calls" for his hexbeams.

After I got back home, I immediately put my hexbeam to work on TN3W, the DXpedition in the Congo, and got them on 18 MHz on the second call.

73 and Good DHex to all,

Tom, N0YD "Yankee Doodle"

786. UNSCIENTIFIC TEST From Alan -K2ACB

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-05-24 14:30:11 UTC
From: acbdzw
Topic: 786 Message: 786

I do not contribute much to this site but from time to time I put my two cents worth of opinions. However before I pontificate I regret not going to Dayton this year. I had been there for the last 3 years but couldn't make it this year.I did have a few little things i wanted and my friends whom I normally drive there with were kind enough to get what i wanted and call me up on their cell phones several times from the hamvention to tell me if they found what i wanted or to ask me what price I was willing to pay. Hopefully next year i will be able to go and meet the Hex beam group there as well.

About two weeks ago I had a qso with Tony, IZ6BXV and Fred N2II. Tony is in central Italy and is using on a 60 foot tower an Italian made tribander and also an Italian made duo Bander for the WARC bands. Fred is on the Jersey shore I would say about 9o miles from my qth and I may have heard him on Ground wave. Fred and I were both using Icom 756 pro's and we were running barefoot for the test. Fred has a 90 foot tower and stacked arrays for 10 -20 meters including the warc bands. Our original band was 15 meters. Tony was coming in about 10 over 9 and I heard Fred about 5and 5. At the time Fred was using 3 over 3 at 37 feet and at 75 feet. Fred was using both antennas against my little roof mounted Hex Beam. Tony said I was 1 to 2 s units stronger than Fred. When he went to the antenna at 75 feet i was still slightly stronger but are signals were the same on his antenna at 37 feet. We then went to 17 meters and tried there. This time Tony said that Fred was stronger on both antennas and together by about an s unit. We then went to 20 meters. There with both antennas fFred was about 2 s units stronger. We then went back to 15 meters and I was again stronger at Tony's qth in Italy when Fred ran both antennas together. I was a little stronger on the top antenna and the samer on the
bottom.

What this goes to show is that conditions can be different from band to band and that the angle of radiation depending on the band and time of day can be very important concerning signal strength. Fred was a little surprised that my Hex Beam at least on 15 meters could out perform his stacked array.

This was my little unscientific experiment which indicates that the Hex Beam is a good little antenna and though it usually cannot out perform the big stacked arrays it gives them a run for the money and is a lot less expensive(HI). From Alan_K2ACB@...

Hi Alan,

I regret you didn't make Dayton this year. It was very interesting
although I had little time to see the many booths since I was at my
booth (W4RT Electronics) doing my job. hi hi

Nice experiment. Points out a good truth about antennas and
propagation.

Have a safe and enjoyable holiday weekend (and everyone else too).

Topic: 788 Message: 788

Has everyone gone on vacation? :-)

My HX-5B is still working FB. Bands have not been too good here, but have had no trouble working R1MVI, TN3W, VK9LO, etc.

It is now planned to put up a HX-5B for Field Day as part of the local club's antenna arsenal. There will be a quad or two I believe. All will be on 40' towers. Will report on how the Hex-Beam performed.

From: lz2be
Topic: 789 Message: 789

Hi guys,

I'm going to built a 5 band Hex-beam. Most of the materials are ready, just the hub and the mast are still under construction. I spent lot of time to make computer models and to experiment with these models on 10m band. The most funny thing is that my antenna is under the roof, beaming to North, at 2.5m above the floor and wires are fixed with nails to the wooden beams of the roof! SWR measured by my FT890AT is less that 3:1 in 28.0-28.7MHz section and is getting higher at the end of the band. It is easy tuned by internal ATU to 1:1. Comparison of Hex to my Inv Vee show at least 3 S-units gain on RX/TX with West EU and Asia, some of stns could not hear me on Inv Vee. Stations from Africa (South direction) are without difference on both antennas.
My conclusion is to finnish ASAP that antenna!

Hi Barry,

tks for the reply.
This under roof antenna is just an experiment to test my different computer models and it was the last and best one. The real 5 band antenna will be about 5m above the roof (17m above GND level).
We have LZ-HAM-meeting during the weekend, where I'm going to buy an 8m mast.

A new 10 & 15 m Hex-Beam is on its way to Ed, P5/4L4FN. He will pick it up on the 22nd in China if nothing goes wrong in the shipping. Bruce, KK5DO, his QSL manager, is also sending a rotor and rotor cable. He will also recieve the WARC add-ons for his vertical. He has a lot of trouble with QRM from JAs. The Hex-Beam's F/B and F/S will help him when working NA and EU. With his new 1 kW amp, Ed should be able to work a lot more people now.

When will it be up and working? No idea, but I'm hoping early July. Ed also has a 10-10 number and plans to be on next fall and winter when 10 m picks up again (we hope).

Thanks Barry (as you see , some of us are not on holiday...hi (soon
that will change!)
I suppose it doesn't matter which side of the radiator you connect
the shield/core of the coax to?

Hello Peter,
yes, there is a mistake.
Change reflecter & driven element and you are right.
A-difference between spreader (center) and the end of wire element of
the reflector.
B-difference between connectors for both end isolators, means
director and radiator (position where the wires end).
B-A difference between spreader (center)and the end of wire element
of the radiator.

regards Holger

Topic: 797 Message: 802

Peter,
this version shows the design with coax feeding between the elements.
But untill I'm not happy with the results. It is fine for 20/17/15m
but SWR on 10/12m was not so good. 10/12m are very sensitive and
influencing each other if you change the length of one.

But back to the hub. I prepared the cables for inside mounting. I
used messing screws M4x20mm and M4x16mm. They are ironed to the wire
to fix them. In the hub I have 3 holes of 6mm diameter. 2 for the
radiator and 1 for the reflector.
By the help of a small Screw driver and a lamp shining into the hub
from the bottom I fixed the screws to the holes. Sounds easy but took
me 2.5 hours ;-) Start with 10m!
The reflector screws were easy (5 min) by the help of a tool fixing
the srew to get it into the hole. This 'tool' was made from 3mm thick
and 80 cm long copper wire.
My center hub is also custom made like the spreaders. It is from
fiberglas (1.5mm thick) and has 35 mm outer diameter. It is stronger
but more light than the pvc tube from a hexbeam and has more place
inside because the pvc tube has a bigger wall. So this makes it
easier to mount something inside.
regards Holger

803. Hex-Beam on the Move

Yahoo group: hex-beam (2001 — 2006)

From: w4wb
Topic: 803 Message: 803

The 10-15 m Hex-Beam safely arrived in Beijing yesterday. If all goes well, Ed will pick it up (plus a rotor and some items for the Butternut vertical for the WARC bands) on the 22nd while on a business trip.

No definite date is known for when he will have the Hex-Beam operational. More updates to come.

Thanks again to those that helped make this support for Ed possible.

From: w4wb
Topic: 804 Message: 804

Hi Folks,

Field Day starts at 1800Z on Saturday and runs basically for 24 hours. This year, all Region II stations can submit logs, BUT all DX stations can make QSOs that count. So all you in Regions I and III, help us out and give us points. An interesting aspect to this event is that all contact carry the same value.

We erected a HX-5B as one of five HF stations (plus 6 m and satellite) this afternoon. I (and my team) will be using it primarily on 20 m SSB, but may jump to other bands if needed. Hope you will listen out for our stations --- K4BFT, that's Big Fat Turkey --- and give us a call!

The other beam antennas for 20 m and up are two-element quads plus some dipoles, etc. When I offered the use of the Hex-Beam (thanks to the loan by Mike), the group jumped at it. Most of the guys have seen/heard the results I have obtained with my HX-5B. :-) I figure we will have some converts before the weekend is over.

Field Day 2002, is now history and the HX-5B performed very well for us at the 20 m SSB station of K4BFT - Big Fat Turkey. Over 1,000 contacts were made; however, even more would have been made if only "experienced" operators had been used. As station manager, I would allow any one that came by the station to operate for a while as part of the training aspect of the exercise that Field Day is all about. This lowered the contact rate of course.

The operating conditions in Field Day are most interesting. My approach is to find a frequency and "park" there and do the CQing. Often other CQing stations would drift to within 1 or so kHz from me up and down. With the propagation being rather unstable, the Hex-Beam gave us a real edge in being the big signal in different areas and for often mitigating the nearby stations. For examples, when the 8's starting coming in, I moved the beam towards that area and attracted even more of them. When I would start hearing 3's call, around goes the HX-5B and up went the rate on the 3's. And so on. Other operators began to get the idea and their rate went up by using the characteristics of the HX-5B to our advantage.

My only disappointment was that we had to mount the 20 m antenna elements of the HX-5B at about 55' AGL since the towers were each 50' tall. I had been told they were 40', but guess the fellow's memory was fuzzy. :-) Having the antenna at this height causes maybe a 15 dB dip in the elevation pattern at 37 degs (in the model at least) and lowers the radiation angle. Due to the manner that the towers are arranged for fast emergency erection, the height could not be changed. If we do it again, one tower assembly will be modified. Did this make a difference? You bet. With the density of stations, I could notice getting a "deadish" band, i.e., I was working stations close to me and farther away from me with a gap in between them for the most part. This was a weird experience that I would not have normally noticed, but since I was aware of the issue of having the antenna a bit too high, I was more attentive the nature of the station locations we worked. I also should note that I swept the HX-5B with the trusty MFJ 259B and the antenna showed a 1.4:1 SWR at 14.00 and 1.2 or less over the phone band. I used a 10-bead ferrite (Type #43 since that's what I had) BALUN located just under the base plate of the antenna. Feed line was about 150' long. All of the other bands looked FB as well. This impressed the other guys a lot, particularly after I swept some of the other antennas. We found one that required a bit of quick attention before the event started.

The most common question I was asked by the 50+ people attending was why do you have a rotor on that omnidirectional antenna. When I explained that it is a beam, eyes crossed. Due to the significant

interest generated, I was asked to give a program on the Hex-Beam at the HARC in the near future. This is good! A modest number wanted to know how to contract Traffie too. Those that operated the station left it with a very positive impression of the Hex-Beam.

I think the final question that many people asked me after the Field Day was over says it all. "Do you think we can use the Hex-Beam again next year!"

Off to get some serious rest now.

Hello Barry,
congratulation on your good promotion!
I had to work on Saturday so I did not made any QSO this weekend. But on Sunday I started to rebuild one of my beams. The new tubes I got will get the design with low impedance line inside the centerhub. It took me 5 hours on Sunday to prepare the cabling and to mount everything inside the hub (including the coax cable). So my feeding is from the bottom and the coax is going inside the center support.
I have to get ready because next week I'm starting for a 3 weeks long holiday trip around Europe (F, EA, ZB2, CT, C31) and will use the radio and the beam from time to time.

Did we got any feedback from ON4CCW and LZ2BE?

best regards Holger, DL7IO

PS. The XE1??? who sent me an e-mail a couple of days ago. I could not come back to you because the mail-address was wrong. Send me your e-mail address again, please.

Well, another one done!!

Propagation was horrible down in the Florida Keys.
Running QRP on PSK and SSB was really hard. Weather,
atmospherics, and the noise level was terrible.

Thanks to Barry for his products which made operating
easier. The Hex Beam was a winner. It was fantastic
on the bands and got me through when I thought I would
not be able to be heard. I even worked "Big Fat Turkey"
on 20M SSB.

It seemed that we only getting one hop range to the signals.
The bands were in and out, mostly out for us.
No wonder NASA landed the shuttle in CA. Down here they wouldn't
have known they were coming!!!!!

Great time and learned a lot for the next time.

Hi Holger,
nothing new here. I'm still waiting a local workshop to finnish the
hub and mast support.
Did you tried to feed the antenna from the bottom side of the twin
line (10m)? I did some computer modeling and there is a very small
difference between top and bottom feeding. If you wish I can send you
both data files.
I hope to hear you when you are on holiday!

Congratulations Gordon! After 19 years using a tuned feeder fed doublet, the Hex is a pleasant change to say the least. I had 3 element monoband yagis years ago, but I have never had something as small as the 5Bi that does so much so well. I look forward to finding you on the air. I have been keeping a sked at 0200Z with N6UB/KL7 on 14165. Maybe you can join us.

Dear friends,
before I leave you tomorrow for the next 3 and a half weeks I wanted to let you know the data for the probably most interesting place I'll be radioing from. I guess we arrive in Gibraltar at late July the 9th and start operating at local night. The radio is a FT 890 and antennas are a HF9V & a reflected W beam with 8m fiberglas mast, made from 2 surf masts.
We also will be heard from CT, EA, and F mostly at local evening/night time.
We are 3 HAM's all together (DL7IQ-my better half-Birgit, DJ7TO-Olaf and me).
Hope to hear you,
Holger

Hi all,
it is finnally there : my beam mounted on a selfmade variabel (4-10meters) mast. In the files section you can find the swr readings maesured with a analyser (borrowed from Marc ON1DO thanks!!)
The antenna was at a hight of 10 meters (33feet) and as you can see it is for most of the bands a bit to low on freq. .10 meters is the worst result, but not to bad.
for modification i would like to use the following procedure :
loosening the connectors on the spreaders and bringing them downwards
make the radiator smaller with the formule :
actual lenght X measured freq
---
wanted freq
after schortening i would push the connectors back on the spreaders upwards untill i have a good tension on the wires.
This way, the lenght of the reflector is not changed!!is this correct?
or should the reflectors be shortened in the same way?(keeping the whole horizontal)
spacing will remain the same as i will not touch them;
The lengthvalues are taken from DL7IO , so is the feeding system.
foto's will be posted in the future
anyone ideas why 10 meters isn't so low on swr like the rest?change in spacing for solution?
btw this is my first attempt to build a beam, so it's kind of new for me.And another remark : i used bamboo for the spreaders and solid cupperwire cause it was the only material i could find at a proper price.The bamboo will be treated after tuning is finished.

well, looking forward to your reactions!(still haven't finished painting the woodwork on the house...BUT the wife said the antenna didn't look to bad !!!???(for an antenna that is...;-))

Peter,
congrats! It does not look that bad. Did you use isolated wire? I think you have some kind of isolation. That may cause in "to long" looking wires. Be careful while cutting them and cut the same length on all ends because the difference between radiator and director is only 2-4%. Start with 20 m and measure first. Be extremly careful with 12/10m. You don't have to cut the wire. Make a knot first to check the length. The best gain is where the SWR comes down under 1:2 and not with the best SWR!!! So try to get a SWR of 1:2 at the band beginning (CW-portion).

god job!
Holger

thanks for the info and have a good trip! i'll hope i will be ready
to reply but my 12volt supply for the transmitter broke down
(speaking of bad timing!!) fortunetely i can proceed tuning with the
analyser. I'll shorten the wires without cutting. At the end of each
wire there is a clamp device on wich the wires are bended 180 degrees
so i can always reverse the process. the pictures make it clear . I
used a copperwire wich has a thin layer of vernish, that's all.
once again , thanks and bring some sunshine with you when you return
to this gray area on the globe!!

Hi Peter,

Look in the Photos section of this list and you will find the data from W6HB (ex-WB6ROH). Also, look at the data taken for the W4WB/W4RT Hex-Beam at www.nadxc.org. Look at the LongPath newsletters, December 2001, page 9. You can get strange results if you don't measure the SWR correctly. Suggest that you use a current balun of either 8-10 ferrite beads over RG-8/213 or make a coax version (maybe 7 turns with 100 mm inside diameter, single layer).

GL es 73,
Barry - W4WB

> few stations and doesn't seem to be the case??

Hi David,

I asked Mike this question and he said that he had heard the same
rumor, but no solid data. Next time I work them, will ask the
question. Their signal here has not been remarkable except on 40 m.
Have worked CY9DH on 40, 20, 17, and 15 m. No copy on 30, 12 or 10 m
as of yet. Of course, it seems they are on those bands when the
propagation is nil between the two QTHs.

Guess you are shoveling snow by now. ;-) Hot and humid here.

thanks Barry,i've checked it out.
i'll make a balun as posted on this site (K1TTT air balune) and
remeasure. I'm just afraid when my swr is to low, i won't get proper
gain.The advice Holger gave me(1.2 on the beginning of the band) ,
is a bit different as what you see on the commercial hexbeam. And
when i look at the results af David (btw , thanks David for the info
you posted!)it's also different compared to the commercial, Holger
and my measurements.(i'm even suprised a can get the swr so low...)
For several bands , the commercial hex uses the left flank of the swr-
curve...Well, i'm not an antenna - goeroe but i'm having fun trying
it out.Hopefully i'll be broadcasting in a week or two!(it will be my
first trans-continental QSO...and it would be nice if i could work
one of you guys)(yes, i'm still a bit green behind my ears= Belgian
expression meaning unexperianced)
I'll post my results of the swr with balun when i'm ready, but a lot
of work still has to been done.btw, it is supposed to be summer here,
but i think somebody up a bove made a mistake...;-)

Hi Peter..... The SWR on my HX-5Bi is lower than the plot on the site shows and is highest on 10 meters (1.6:1.0). Please do not assume that a low VSWR automatically means poor gain. Barry, Herb and I have all found that not to be the case. When you are ready to test that beast, drop me an E-mail to "w6hb@..." where the PC in on line if I am in the shack. Most nights from 0200Z to 0600Z or later on Saturdays and Sundays I am available and the band has been open to Europe. 73 - Doug - W6HB

Hi Peter,

A characteristic of this antenna is that the SWR rises rapidly on the low end of the band. This can be considered the bottom of its band. It can go from < 1.2 to > 2 in just a few tens of kHz. Low SWR does not mean good gain or F/B.

Drop me an email for a test. I can get on typically from about 1400-2200 Z. EU normally FB during this period. Try barry@....

Oh yes, we have those same "green ears" here in the US too! :-)

Hi Barry,

Is the use of a ferrite or coax balun recommended for the commercial version
or just for user constructed ones? I hope to put my #231 up next week.

73 de Eric.

Hi Peter,

Look in the Photos section of this list and you will find the data
from W6HB (ex-WB6ROH). Also, look at the data taken for the
W4WB/W4RT Hex-Beam at www.nadxc.org. Look at the LongPath
newsletters, December 2001, page 9. You can get strange results if
you don't measure the SWR correctly. Suggest that you use a current
balun of either 8-10 ferrite beads over RG-8/213 or make a coax
version (maybe 7 turns with 100 mm inside diameter, single layer).

Hi Eric,

In my opinion, it is unwise to install the antenna without the balun (homebrew or commercial). Will the HX-5Bi work without it? Sure. However, the balun will keep your line from radiating, etc. I like the ferrite balun due to its wider bandwidth when compared to the coax balun. For this antenna, Type #73 or the like material is best (say 5 to 6 1" long beads) although Type #43 will do the job if you use perhaps 10 beads. Type #73 is harder to find and costs more. The coax is ok, but has less bandwidth. Use a 4-1/4" O.D. PVC pipe as the form for RG-8/213 and make it single layer. With the antenna about 38-40' AGL, this will work fine. Remember to run the feedline as explained in the instruction manual (between the driven and reflector elements on the shield side of the center post). The balun should be located just below the antenna base (or just below the rotor relief coax).

I believe you will find Traffie's opinion doesn't differ much from mine.

Let us know when you are on the air with it and perhaps we can have a QSO!

FB Barry, thankyou - I had omitted to give consideration to a balun so the topic on here was timely and your advice is appreciated. I'll let you know when its up and also my findings in the comparisons I will do with my GAP Titan. I hope to do it Monday but I've scheduled and postponed so many times I've lost count - we are having a very wet summer and it has always rained when I've wanted to do the beam. Also to do the work I have to access the adjacent field but have already found out to my cost that the 200+ resident sheep are not the friendliest of creatures!

Eric.

830. Wind load

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-07-06 19:16:14 UTC
From: Marty N5NW
Topic: 820 Message: 830

Is there an actual wind load figure out there anywhere for the antenna (5 Band)? I need the information to look at a proposed tower installation, and need to prove the tower is strong enough freestanding (35 ft. Rohn 25). I know it will be plenty, but just need the load factor.

Thanks de N5NW/8 (Marty)
Bellbrook, Ohio

Hi Marty,

Traffie's web site states for the HX-5B, the flat plate wind load is
est. to be < 5 sq. ft.

FB Eric. Only took me 15 months to get around to getting my Hex-Beam up in the air. Rather dumb to have wasted the peak of the solar cycle with the beam sitting in its box. :-) Even so, I raised my DXCC count from a bit over 145 last November to almost 270 presently (with 206 confirmed). FWIW, I also use the ferrite balun on my Titan with good results.

Oh yes, just be glad the field isn't populated with goats!

Nigel,

The numbers are the same regardless of the antenna (see prior
posts). The issue is bandwidth. For the Titan, Type #73 is better.
Being that I had a number of Type #43 laying around and the Type #73
is more expensive, I used 9 or 10 1" long split beads. Each bead is
expoxied and the lot of them are contained in heat shrink. The
performance falls off for the lower bands, but is generally
adequate. #73 resolves this matter.

It appears from the Palomar and Amidon web sites that type 73 is not available in toriods (only small beads) and has been replaced with type 77.

Hi all,

Looks like the guys at CY9DH did pack their Hex-Beam.

Check out http://www.geocities.com/stpaulisland/CY9DH.html for pictures..

Hi guys,
I had CW QSO with Holger and his team yesterday on 40,20 and 15m bands. Signals were very strong and there was a good pileup!

Nice VSWR curves Peter. Based on info from Barry, W4WB, and Mike T., the performance on Mike's units have best gain and F/B at just above the frequency where the VSWR climbs rapidly at the bottom of each band. Over the width of the band the F/B drops about 10dB and the gain less than 1 dB. Have you had an opportunity to evaluate performance yet? I suspect you will find that minimum VSWR and optimum full band performance will not be at the same point. 73 - Doug - W6HB

Hi all,
Just a note to introduce myself as another hex-beam user. I'd purchased the six band (one at a time) portable HXP-6TM and was happy with it. Now I've purchased the HX-5Bi multi-band hex. I expect to have it operational by Jul 21st.

Everyone's comments on this group has been helpful to me. From your comments so far, I've purchased two right angle connectors so I may run the coax directly down the side of the centerpost; I've ordered a current balun ferrite bead kit from Polimar in Texas; painted the spreaders camo to blend in with the surroundings; and have enough coax-seal to seal my entire house. If anyone has any other suggestions for me to consider before I get it up in the coming week, please feel free to let me know. 73's, Ed Fox, KB0OKV (Minnesota)

Welcome aboard,Ed. Looks like you have just about everything covered. I see have read the paperwork and realize the importance of running the coax down the feed tube correctly. Hopefully you will have minimal near field metal and adequate height for a good takeoff angle. Keep us posted on your progress and drop a line when you would like a sked to run check outs.....Doug - W6HB@...

Hi guys, just to let you know that my 12V supply still isn't back
from the store(was promissed for today...)Thanks for the offer
Barry& Doug. Sure will é-mail you guys but wensday i'm off to the
south of France (there will be sunshine over there i hope :-)...)
I'll be back the 27 of July and no , i' won't take a ham installation
with me (the misses won the battle , not the war!)
thanks again! btw, according to the info i'll still make the wires a
bit shorter , but first i'll try it out as it is for the moment. As
you can see on the foto's , it is handy to work on the antenna with
the mast in its lower position.(i'm afraid of hights you see, sure
picked the wrong hobby, should have collected stamps...;-))

855. Hex-Beam at P5/4L4FN

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-07-14 05:23:43 UTC
From: w6hb
Topic: 855 Message: 855

Ed, P5/4L4FN, informed me within the past hour that he has worked the bugs out of his 15/10 Hex-Beam installation and is starting to see benefits over his Butternut vertical. He started out with poor VSWR and no apparent gain over the vertical. Barry(W4WB), Mike Traffie (N1HXA)and I have been working with him via E-mail to gain the results we knew were possible. His latest report touts VSWR of 1.15 to 1.2 and in QSOs with his homeland 4Ls from P5, apparent gain of 3 to 5 dB. The main problem was that the antenna was too close to near field metal such as rebar, radials of the vertical and satellite dishes. He is now at about 8 meters and plans to go to about 10 meters above the roof. This should improve his TOA and maintain performance. Check out this site's photo section for Ed's current installation.....73 - Doug - W6HB

Hello,
I worked my first contest, for the HexBeam and for Me.
I have only been licensed for a year.

Results:
Phone Only
Single OP
578 QSO's in 17 Hours
77 Multipliers
129,822 Total Points

Based on past Scoring History, I will place for my Section (MO).

Thanks to the HexBeam
It's Like Shooting Fish in a Barrel.

859. Hexbeam #231

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-07-16 07:30:14 UTC
From: Eric Carling
Topic: 859 Message: 859

Hi folks,

At last its up! We got a nice sunny day yesterday for a change and the sheep in the adjacent field have been moved somewhere else.

My antenna situation is a bit difficult because of overhead power cables running across the property in two places. This is what led me to install a GAP Titan vertical 4 years ago, which has worked surprisingly well (for a vertical). So positioning my lightweight mast was not easy and finally I had to put it under power lines which restricts the antenna height to about 25 feet. The proximity of the lines has some effect on SWR, though only when the antenna is in a W to NW direction and thats only on 20mtrs.

I had a play yesterday evening and this morning on 20/17/15 - no band opening on 12/10 yet. Straight away I noticed a big improvement on received signal strengths over the vertical. Typically 2 S points, sometimes more. This morning on 20 mtrs as the band opened to W6/7 and the Pacific, the hexbeam was initially 6 S points up on the vertical reducing to 2-3 S points when the band was fully open. European signals were not much different between the beam and the vertical. These "measurements" are by way of the SWR meter on my FT1000MP.

Front to back seems good, I need to check it more. SWR, notwithstanding the above problem is very good too. In fact on 15m the SWR is very flat across the whole band. I've always thought this is not a good sign and that a good antenna should exhibit a noticeable resonant point. But it is definitely working well on 15 so who am I to complain? Maybe someone can introduce some comment on this.

I had to use the coax type balun as the ferrite cores hadn't arrived. They ve come in today's post would you believe but now I think I will stay with the coax type. I'm in good company, having seen those excellent pictures of the P5/4L4FN installation with coax balun.

So thats my initial report - hope you guys don't mind reading it, couldn't resist because I'm so very pleased with the results from the Hex.

I wonder if anyone has done anything to repel birds or is it necessary? Mine attracts the large rook and crow variety, some of which have a penchant for pecking at something on the antenna. I'm a bit worried that they might cause damage - or is it bird proof?

73 de Eric G0CGL.

From: w6hb
Topic: 861 Message: 861

It seems that we have many happy Hex-beam owners and very few who are not. It is surprising how many stations I work who have never heard of the Hex or are somewhat surprised at its performance and simplicity. When I look at the product reviews on EHam.Net, I see that the Hex has been reviewed 20 times by at least 17 hams. Some have deflated their 0 to 5 product ratings for what appear to be other than technical or performance reasons. Many potential buyers utilize these assessments and when they see other than a 5 (equates to the 59 contest report I guess) they assume something is wrong. The more data that is presented, the better. Let's get out the honest word. Let others know what you like or don't like. Many of us have QTH restrictions that direct us to smaller or lower antennas. If you are in this category, how much of a compromise do you believe you have taken by going with the Hex? Do you have experience with other antennas with small footprints such as the C3SS, TGM, or whatever? Let others know of your experiences. Maybe you will be Elmering someone like you who has improved their station's performance and enjoyment of the service. 73 - Doug - W6HB

Hi Doug,

Yes I will do that. I was dog-tired last night and didn't operate. Condx wern't too good either. On the evening I put it up I got two comparative reports on my transmit signal, both from east coast USA: both QSOs 5/6 on the vertical, 5/9 on the beam. But I would like to do the same with W6/7 or VK/ZL - maybe tonight if the band is open. I'll report to the group again when I get some useful data.

I was interested in your message, 'Spread The Word!' I read through the e-Ham reviews before buying and noted that the average mark of 4.5 was affected by a mark of 2/5 and one of 1/5. Yet in those reviews there was hardly a bad word about the antenna and I didn't consider those marks to be valid. The average was really better than 4.5/5 The only non-technical/performance critisism of any validity was that of the cost of purchase.

Prior to moving to this QTH, I operate from a house with almost no garden and used the TGM type mini-quad 2 ele beam. The Hexbeam is significantly better in performance. Corrosion and wind damage degraded performance of the mini-quad after about 4 years, something which I doubt will happen to the Hexbeam.

At this QTH, I don't consider a Hexbeam to be much of a compromise at all. The compromise was in selecting the Titan vertical. I should have gone for a Hexbeam, which 'feels' like a full-size 2 or even 3 element beam, and then put something else up dedicated to the low bands.

Eric G0CGL.

863. Hexbeam #237

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-07-17 19:41:13 UTC
From: wtanigawa
Topic: 863 Message: 863

Well, I've been lurking too long without comment and I need to thank all the contributors for many insightful comments. A few nights ago, a ham in Japan asked me to describe the hexbeam and I'm sure I convinced him that I was nuts. "Draw the letter M, now just under it, draw the letter W" Huh?? How do you get a Hexagon from that? With your help, I gotta' come up with a accurate description in less than 30 or so words. HIHI.
Someone asked for a reason for the flat swr on the resonant sections of this 5-band antenna and I've been puzzled too. When I checked with a MJF, I thought it was broken because the hexbeam was flat over almost all of the bands. So, I've been thinking (always a dangerous thing!), because of the way the hexbeam is fed, even if one is transmitting on one band, do all the DE's radiate? Something like a log-periodic? In fact, does the hexbeam resemble a LP in more ways than a quad or yagi? I have found out by experience that this is one long-haul antenna. Some of the stations I've worked have told me that they've never even heard Hawaii on the band before. Often on the back of their beams and I usually run only 100W.

Just a quick note on comparative reports on my transmit signal, Hexbeam v Titan vertical, obtained last night.

I got comparisons from a couple of stations in USA including K6MYC plus VQ9FW and V51KC. They all said I was 2 S-points stronger on the beam except for the VQ9 who said I was 3 S-points stronger. Also I was able to quite easily break the pile-ups for the VQ9 and V51 plus pile-ups for 3DA0CF & 5K0Z (3 bands) with the 1000MP barefoot. At this rate my new Acom 1000 amplifier is going to be a bit redundant!

Eric G0CGL.

867. Hexb-beam on St. Paul DXpedition

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-07-18 23:52:02 UTC
From: w6hb
Topic: 867 Message: 867

Here is some information I asked for and received from W0SD who ran
the HF operations on St. Paul using a HX-5B.....Doug - W6HB

This is from Ed W0SD who was in charge of all the HF operation on St.
Paul and it was my HEX Beam. You may feel free to post this where
ever
you like but please use my call with it.

I have used the HEX Beam in AZ this winter to work Ducie IS. for a new
one. The XYL and I both worked Ducie on both SSB and CW in the first
14
hours of the Dx-pedition. We also used it from Lake Chapala in Mexico
and than used it on St. Paul and plan on using it from FP.

The reason I bought a HEX beam after a lot of thinking and
investigation
is that it is the ONLY ANTENNA I know of that uses one coax and goes
on
5 bands and is light enough you can get it up and keep it up on a
portable mast and can be put together in 30 minutes and taken down in
15
minutes.

I use a 20 foot flag pole to mount it on at St. Paul. The other
places I
had my 5th wheel so I also had 8 foot of alum pipe for a total height
of
about 30 feet.

Other considerations are low SWR over all of the 5 bands, stands up to
high winds, ie does not have a lot of wind load, reasonable gain and
F/B.

I now have things pretty well worked out. I have a mount made out of
alum pipe with PVC in it that just fits the end of the flag pole. The
PVC is slit for about one inch above the alum pipe and I have a husky
clamp that I can tighten and with the PVC split 2 ways I can hold the
flag pole from rotating in the 40-50 mph winds we had on St. Paul. I
have a guy ring at the top of the flag pole and had it guyed. It took
the winds at St. Paul which were really gusty with a terrible down
pour
of rain. The base is buried in the dirt with a 2 x 4 bolted to it so
it
won't rotate. Where it is to rocky to bury such a St. Pierre I will
pile rocks around it. We also used some rocks at St. Paul. For guys
if

you can't get stakes in you can use bags/tarps filled with rocks or logs
with rocks piles on them. All of these will hold the HEX Beam up to at
least 55 mph winds. It has done it in actual usage. I would assume one
could go to at least 75 mph based on experince I have had over the
years. The limiting factor would be the strength of your guy points. I
would have no concern about the antenna.

I find the wife and I can put the HEX beam together in 30 minutes
easily. It works by far the best to have two people. We leave all the
wires on the fiberglass poles and just take the joints apart and tape
the wires and poles together and put them all into a bag I had made. We
put in everything but the center hub.

I have a mobile quick attachment mounted on top ofathe flag pole and the
other part of it on the bottom of the center hub(I did some welding) for
the HEX beam so once the HEX beam is put together I can reach the top of
the flag pole and quick attach the HEX beam to it. This is possible
since it is light. On St. Paul with the wind blowing I had one person
help hold it while I mounted it since we did not want it to get broken.
My experience is that even if one would drop it the chances of it not
breaking are pretty good. It is a lot tougher than it looks.

It definitely worked very well when I have used it. There is definitely
noticeable F/B and gain. As mentioned in the literature the F/B does
seem to drop off as you go across the band. The truth of the matter is
on St. Paul it worked well to put the antenna between Europe and
Japan(fairly broad front lobe) and work the USA off the back or vice
versa! When we wanted all the signal we could get such as on 10 or 12
where signals were weak pointing it where the band was open made a huge
difference.

My experience shows the antenna works decent at low heights of even 12-
15 feet and certainly does well at 25-30 feet. We A/B switch tested it
against a beam at 60 and 90 feet and it did very well. Not as strong
but for the difference in height not a lot of difference. As one would
expect on low height showed up the most on 20 meters but even then was

decent at 15 feet!

What are the downside: One tends to tighten the screws fairly tight to
hold the wires and over time the threaded studs are going to break off
and I am going to have to do some repairing. Over time the wire is
going to get frayed were it goes through the holders on the fiber glass
poles as it has to be tight because of the pull of the bent fiberglass
so eventually there is going to be a need for some wire repair. Both of
these are problems for my type of use as a traveling antenna and would
not apply to a fixed location.

BTW I just tape the fiberglass joints and that seems to work great.

The other downside is the price. It is really getting out of sight but
then when I look at what other 5 band beams cost I have to say it is in
the ball park! The reality of life is that other 5 band beams do not
have all that much gain over what the HEX Beam does and they weight a
lot and take a long time to put together and would be basically
impossible to take on a DX-Pedition and get up and keep up.

I was hoping the HEX beam would not be subject to precipitation static
but it is. As to how it compares to a beam I have no A/B comparision
but we did get precipitation static at St. Paul but then we nearly died
from a lightening strike. We were high up on the rock and one hit right
by us. Man it was something!!!

Will try and report on the results from FP

73, Ed W0SD

868. Hexbeam #239 operational this Saturday the 20th.

Hi all,
I expect to have HXBi-239 operational from my Faribault, MN. QTH tomorrow (20th) by noon local time. It's 30' off the ground and I'm looking forward to anyone who might want to chat. 73's, Ed, KB0OKV.

Hi Ed,

Good news. So what frequency would you like to try? Say 18.130 +/-5
at 1900Z (2 P.M. CDT) Saturday?

872. 5-Way Hex-Beam QSO

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-07-21 02:24:13 UTC
From: w4wb
Topic: 872 Message: 872

This afternoon at 1900Z, Gordon VA7XG, Ed KB0OKV, Barry W4WB, Bill G3MCS, and Barry K0QV had a FB QSO on 17 m. I was Ed's 2nd QSO on his new HX-5Bi. Sounded good. All stations were 56-58 here in Alabama except Gordon who was a bit weak due to propagation - reverse true as well. Bill had a big signal from England with his 400 W.

Tnx guys for a good QSO. Five HBs at once isn't too bad!

Topic: 873 Message: 873

Dear friends,
after 3 beautiful weeks full of new impressions we are back home now. We have been to F/C3/EA/ZB/CT/LX driving more than 7500 km and making much more QSO's. The top spot was like expected ZB-Gibraltar where we made 5563 QSO's (5379 in CW) in 2 days with one radio. Most contacts were made on my homemade beam. Our QTH was at the only HAM-friendly hotel in ZB which is on the east side of the rock. The beam was about 8m over the hotel roof, about 50m over sea level but only 100m east from top of the rock with about 400+m. So we had not the best conditions for the states but nevertheless we got a few hundred W's into the log.
I will give you some photos later in the photo section.
regards Holger, DL7IO

Welcome home Holger,

my hex is completed and i have just taken some B/F measurements. It seems i have +/- 12 db on all bands ,all of the bandwith . I'm now looking for the gain values but for that i think i must be able to compare with a vertical? I tried the "hexbeamfreq.s" a few times but only the 20 meters was open and was crowded with contests. as my father died last week, my priority was of course not ham-activities, but it helped working further on my installation to put my mind on something else. I know that this issue isn't the purpose of this group, but i like to think that it should be possible , we're all human afer all??!
very nice results on your trip.
Peter

It is easy to assemble taking less 2 hours with 2 people who have never seen one and a little longer with 1. It covers 5 bands with reasonable gain. It is smaller and I believe more survivable than a quad. I can not provide you with side by side shootout data. If you will read through the hundreds of posts on this site and the testimonials on www.hexbeam.com, I believe just about any questions you may have will be answered. 73 - Doug - W6HB

I am one of the least handy people I know and I put
mine together alone in about 2 hours. It is very
sturdy. Once together it is easy to pick up and tote
around. I can't compare it to a quad but it is much
better than all of the wire beams I have owned. It is
expensive but considering the amount saved on tower
and rotor you probably come out ahead.
I highly recommend it. Bill K4BYR

Working on a 6 meter homebrew hex and am having problems with getting it to tuneup at 50.1 MHz. I tried the same formula as my 10 meter version but it does not seem to be correct. I would appreciate any dimensions that have been successful for 6 meters.

Thanks!

Well it looks like it's going to be some time before I have the time and cash to erect a tower to put up my Hex due to some other more pressing home improvement projects. Rather then having it sitting new in the boxes for another year or two I'm going to sell it. I took delivery of it in February 2002 and had ordered it from Mike prior to the price increase the first of the year. If you know of someone planning on the purchase of an HX-5bi I can save them some cash. The beam is new in it's original unopened shipping boxes. $786 shipped... save about $140

have another question. i have a tower with a hazer on it. will the hex beam clear the hazer or are there too many wires. it looks like it might clear it. please advise me. thanks 73 rich.

887. Does roofing affect performance?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-08-14 15:54:28 UTC
From: Marty N5NW
Topic: 887 Message: 887

I am contemplating a 5Bi purchase and have been told that roofs can detune the antenna. I have a standard shingle roof on 1 1/2 story (sunken basement), and was planning a 35 ft. tower installation. The antenna would end up at around 40 ft. or so, which would be 20 ft. higher than the roof surface.

Most of the photos on the web page show this type of installation. Does having the tower adjacent to the house present a problem with a standard shingle-type roof?

Hi Marty,

Yes, any structure you place near any antenna will affect its tuning and performance to one degree or another. You should have no problem the way you desribed your intended installation. Herb had one of the most interesting near-roof installations. After some fiddling, Herb is getting FB performance and happily working good DX. Hey Herb, how about a comment or two?

Now is a good time to get up the Hex-Beam. Propagation will soon be improving. Since last November, I have gone from 145 worked to about 275 worked (221 confirmed). First-rate antenna in both performance and construction.

73 de Barry - W4WB

Dear Marty and Barry:

Well, I'm not 100% sure my antenna situation is "interesting", but I can say that it works very well.

I live in a 2-story CA-Spanish house with a tile roof and a small central flat section. The HexBeam is on a short Glenn-Martin tower (5 feet I think), and I have a 2 foot mast on the tower itself. Thus, the antenna is about 6-7 feet above the roof, and about 30 feet above ground level.

All in all, I think you should have no problems. SO..buy it and enjoy it!

Oh, by the way, the lowest cost Yaesu rotator works great...and I have been told that a TV rotator is also OK.

73s,

Herb K6HJM

PS to Barry: Just bought an ICOM 756 PROII...best thing since sliced bread!!!!!! I love it!

From: k0fuz
Topic: 890 Message: 890

Marty, I have had my Hex beam for a little over a year. It is installed on a tubular crak up tower. It extends to 40 feet. It is attached to the house and we have a pitched roof made from cedar shingles. I am very pleased and having fun. It survived a major ice storm this past winter without a scratch. I have worked a bunch of countries.

Its design is effective and different enough that it does not look like the traditional beam - which helps with the neighbors.

Factory support is great - Mike Traffe and his family crew are all the kind of people you would like to do business with.

Take a look at my installation on qrz.com or the photo I have on this site.

I have given you "qualitative" answers but I have had very good luck with it!

891. FS measurements

Yahoo group: hex-beam (2001 — 2006)

Topic: 891 Message: 891

Hi all, i've taken some readings with a fs meter (swr meter with a small antenna on top, had to make the antenna longer to have proper scaling) and there were two supprises :
- the max reading isn't always in front of the antenna (this is the case for two of the five bands) varies between 0 en 20 degrees deviation)
- the max reading isn't always where you expect it to be according to the swr readings and explenation found on this site .I wanted to know on what freq i had the max gain . you can see the result on my file map. the freq with max reading of fs is marked with a gray background.
i measured as followed:
fs meter one meter away from transmitter, lowered the antenna untill it was at the same hight as i am, this means the signal has to travel through the building.
I think i'll re- measure at full hight (36 feet) and try to position the fs meter as free as possible, hoping i still have a reading strong enough to see the needle move.
Any ideas anyone ? (for max gain measurements)
thanks. btw , made some nice (> 12.000 miles with 80watts) contacts
Peter

Hi Peter.....I am confused by your referenced file. Are your VSWR and R and Z readings taken with an MFJ-259? What is the height of your Hex when these readings were taken? What is in the near field? Do the readings change when you turn the antenna? Which data relates to your reported near-field readings? Do you have comparable data for 1st or 2nd hop distances? Is this the commercial 5 band Hex or a homebrew variation?.....73 - Doug - W6HB

HI Doug, i'll try to answer as far as i know (learning all the time...)
The results are measured with a MFJ-259B with the antenna at a hight of 36
feet (11 meters) The antenna is located close to my home (see foto's, i'll
take some better onces when i,have a better camera) but is about 3 meter
higher then the highest point of my roof.(45 degree angle-roof) I'll check
out the readings whilest turning the antenna . Don't understand the" which
data relates ...." question. Please clarify. Don't have data for 1st en 2nd
hop data . Can you help me out how to achieve this?
The antenna is homebrewed.
So that's it . Hope i'll get a bit smarter in the future!
Bye
Peter ON4CCW

Hi Peter.....I figured out what you were trying to show with VSWR, FS and frequency. VSWR and maximum gain will not have any direct correlation. Anything conductive in the near field (the wire in your #3 photo, house wiring, etc.) and the fact that the currents in the driven element are not perfectly balanced will skew the pattern somewhat. To see what the antenna is really doing from a DX perspective, try the following. Establish QSOs with stations out about 1500 and 3000 miles. If QSB is minimal, while transmitting CW have them plot your apparent signal strength as you rotate the Hex. As no S meters are gospel dB wise, this will not give you a metric that any engineer will recognize, but will provide a rough idea of pattern. Keep up the great work and keep us informed on your findings.....73 - Doug - W6HB

Hello Peter,
congrats on your fine work.
Let me give you some comments on measuring antenna gain.
If you are measuring on your home installation (antennas close to any environment like buildings, fences, power lines etc.) you will never get useful results. That was the reason for me to do the measurments in the countryside.
What is needed? You need the antenna installed in a proper height and the receiving antenna with the sensitive millivoltmeter far away (a few 100m would be good) at the same height. Between the antennas should be nothing. The feeding of the antennas is also critical. The best would be a transmitter/receiver direct at the feeding point without any coax cable. Coax cable will have an impact at any frequency and may cause some results that are difficult to understand. It would be the best to have a reference dipole for every frequency you want to measure. For a 5 band beam that means 5 dipoles.
For the receiving antenna it is important that it has no resonance in any of the measured bands. F.E. make a dipole much shorter than your smallest antenna. Otherwise you cant say anything about gain. The best is: Don't take the measured voltage for gain but compare it to the results with the reference dipol. This should be the basis for any results. Compare the antenna only with the results measured with your reference dipol. Because the influence of coax cable, resonances of the receiving antenna etc. will be nearly the same for both antennas.
By the way Peter, don't forget the impact of coax cable for your SWR-readings...
I hope I did not confuse you to much.
Holger
PS. My deepest sorrow for the passing away of your father.

Topic: 898 Message: 898

Hi Folks,

I'm sorry that the previous posting was by a spammer. I have banned and removed him, and deleted the message.

If we start getting more of these type messages, I will place the site on moderated status for all NEW members. If they proved to be a valid members, then they will be placed on unmoderated status as each of you are presently. We had to do this on the FT817 Group. On HFPack, Bonnie moderates every message. Bummer of a job!

Now the good news. Bands are getting better. I got a 30/9 report from a PY on 10 m today. 15 m was wide open and 12 m wasn't bad. 18 m was excellent. Fellow in Poland and I had a chat that was like sitting in the room with each other.

Don't forget that Jake is on Wake Is. now till mid September and is operating from about 0600-0800Z around 14.260-264. He is new to working pileups and likes to get your name and QTH. Goes by the #'s and areas. This is a relative rare one (#83) and will get rarer very soon.

Cocos-Keeling Is is on for a few days more on 15 m RTTY & SSTV. Good luck!

73,
Barry - W4WB

Thanks for the info Holger. Got the general idea. But performing it, is something else. Need time, and space! I have for the moment an trapped inverted V which is about 3 meters lower. Maybe i can take some measurements with a ham located about 3 km away. It's not ideal , but it will give me an idea conserning the best freq on each band and main radiaton-direction. Can't leave the effect of coax ou this way , but i don't see an practical solution. the idea from Doug is fine as long as you have a solid and constant signal i think. Also thanks Doug . Have to think this one through...
Peter

Hal:

I painted mine with grey primer (Rustoleum) and it seems to work great! I did not test it prior to this painting since I wanted to hide it as much as possible as soon as possible.

By the way, I tried not to paint the ends of the wires where they were attached to the mast or to the screw connectors.

73,

Herb K6HJM

Yes I did and no it didn't. I painted the spreaders only, the copper will oxidize and darken quick enough. I would suggest using a couple of different colors to create a camouflage pattern, this helps make the spreaders less visible against the sky. You might use gray primer, flat black, and a flat blue if you can find one.

Congratulations! I hope you find it to add as much to your operations as I have. Have you run any tests between the full 51' plus height of the W51 and the Traffie recommended maximum of 40'? I run at about 31' and have consistently good results. 73 - Doug - W6HB

Hello Group:

Have been sitting on the sidelines but am finely getting to the installation and am concerned about mounting the Hex 5bi on my 65 foot tower. After searching the archives, and following the messages over the last 18 months, 65' is indicated to be too high. I am curious if any of you can give me an idea what type of signal/lobe pattern and distance I am going to be optimized for at the 65' height.

Tnx in Advance,

Paul

Hi Paul,

I recently put my Hex Beam on top of a 75 foot tower (the 20 meter elements are now about 80 feet off the ground).

I can't make direct A/B comparisons to other heights, but in the past I have had my Hex Beam at 35, 45, and 55 feet off the ground.

For whatever it's worth, I have noticed no degradation in performance as I have put the antenna higher. I primarily work DX, and Mike has told me that it should perform better for DX work at higher heights, particularly under marginal conditions, with a lessening in performance for stateside contacts.

Whether it is imaginary or wishful thinking, I am noticing stronger signals, particularly on 10 meters, at the new height. Again, Mike indicated to me that this was to be expected.

I am quite pleased with its performance at 75-80 feet. Again, I can offer no better than my own anecdotal evidence, but I wish you luck at whatever height you decide to put it up. Obviously, it performs quite well even at lower heights, as my experience with it also attests.

Good luck and

73,

Tony, AD1Y

Hi Tony,

Good to hear how the high HB is working at your QTH.

I think Mike Traffie is the only person that has multiple Hex-Beams at different heights operating at the same time. If I remember correctly, they were at 35', 60', and 90'. As usual, the answer upon which is best depended upon the condition of the ionosphere, time (date), and QTHs being worked. The higher you take the HB, the lower the radiation angle (no surprise there) and teh creation of nulls. In general, Mike said the lower one worked the best, but at times, the mid or higher would be far better.

My goal is to have the antenna on a motorized crankup tower for yet one more knob to tweak --- adjust height as needed. :-)

Hi Barry,

Yes, a motorized crank-up tower would certainly be a great way to vary the height according to need.

Mine is a military surplus crank-up using aluminum tubes so motorization is not feasible.

The HB has not disappointed at any height I've had it thus far. I'm just glad that some of the reservations about going higher have thus far not manifested themselves for DX purposes in my own experience. Of course it's possible that I may have had better signal reports at lower heights, but the higher height hasn't prevented me from making the contacts needed.

Mike mentioned the same thing to me that his HB at lower height generally performs better, especially stateside, but that the antenna at 90' was better at DX at grayline and long-haul.

(Not to mention that I think it just looks so much cooler "way up" at 75-80 feet!)

Good luck with your motorized tower project!

73,

Tony, AD1Y

Hi Tony,

I couldn't agree with you more. When installed properly, the Hex-Beam seems to perform well from close to the roof to way up there.

How about posting a photo of your current installation in the phot section? Am sure others would like to see it too.

BTW, what is your present count now? Busted 325 yet?

As far as if your signal would have been stronger at some of the DX stations, who cares? All that really is important is to make the contact (and make it on the 1st or 2nd call ;-))!

Barry,

I'll try to get a decent photo to upload. It's somewhat difficult because my HB is surrounded by trees, and with an olive drab tower the installation is virtually invisible. I'll try to get an angle that's conducive to a decent photo.

Another thing I'm noticing with the antenna above 75 feet is that the amp is in standby mode more often than not.

The current count (in 5 and half years as a ham, 5 with HB) is 324 worked/323 confirmed so far (waiting for Ducie card to arrive in mail). Hopefully the CY0 operation will take place as scheduled.

Anyway, good talking with you again and hope to see you on the bands.

930. Hello to all

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-09-16 03:19:16 UTC
From: Meiselman
Topic: 930 Message: 930

Just a fast note to say hello (HELLO!) and to say that the HB is still doing great things for me. The count (confirmed) is very close to 200 and seems to grow bit by bit. Just added a new radio (ICOM 756 ProII) which works very well with the HB. By the way, I still do not bother to use an antenna tuner...my MFJ now functions only as a power meter when I use the MFJ switch to connect to the dummy load for tuning the amp.

73 to all, and to any Jewish HB users...best wishes for the New Year.

936. AFTER THREE DAYS WITH 5 BAND HEXBEAM AT 23 FEET

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-09-17 14:19:13 UTC
From: fredki6yn
Topic: 936 Message: 936

I moved to a new QTH with a national park bordering my backyard. I wanted an antenna that wouldn't cause 'problems' with the neighbors even though there are no CC&Rs; at my old QTH I had a 2 element cubical quad up 55 feet. N6TZ and I put up the hexbeam on my tower; I left the tower down at 23 feet and see no reason to crank it up! Amazing, I only work CW and have worked Russia, Japan, and all over the eastcoat QRP on 20 meters!

I used my Icom 756 PRO to take a look at the antenna's characteristics on the air. Awesome is an understatement, watching the pan display as I rotated the antenna, signals at 40 dB disappeared at the side i.e. going from east to North. I'm not saying that the front to side ratio is 40 dB, but there were several big signals on the display that disappeared. The front to back apeared to be about 24 to 28 dB. Of course these are not accurate but probably indicative of the antenna's performance. The preceding was done with both preamps secured, so the 40 dB reading was above the noise or about equivalent to S9.

One must take into account that I'm up on a hillside. Working DX stations can be an artifac of skip conditions and polarity at time of arrival or even multipath. But the bottom line is that I'm having a blast and you can't see the antenna from the street because it is behind two trees and just barely above the roofline.

I ragchew, I don't chase cardboard and will only answer a DX call if I think there is going to be a ragchew in it. Not a T U QSL via Buro type thing.

My primary rig is a Ten Tec Omni 6 Plus and with the Hexbeam, it doesn't get any better!

The antenna took about an hour and a half to put together and the directions were great. The quality of materials and workmanship are excellent. To those that say it is expensive, I invite them to spend the time it must have taken to perfect this design. Antenna, especially multiband antennas, are as much experimentation as analytical to get them to work. I think the antenna is a great deal. I'd recommend it to anyone.

Yes, this weekend it will go up during the evening to see what the difference in performance is at different heights on all bands! I will let you know the results.

Yes, it can be loaded, using a tuner, on 40 meters and I did that, but then again, you can load anything with the right tuner. I will still go for a 40 meter wire hidden in the trees!

73,
Fred

Glad you like your new umbrella, Fred. Mounted upside-down like that
they work great and catch more than rain! Nice QSL card even though I
operate "all others." I would love to work you on phone. I am told
Ten Tec gear does also have a microphone input. Having had my HX-5Bi
for about a year now, your results mirror mine at a height of ~31'
ans never more than 100 watts. The HexNuts have tried to establish
SSB common frequencies and have had some requests for CW get
togethers as well. Would you be willing to start something along this
line? Please let W4WB or me know if you are interested. I have 75 and
40 meter capabilities if you want to stoop to a SSB
ragchew! 73 - Doug - W6HB

939. HEX BEAM UNDER CONSTRUCTION

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-09-17 20:49:58 UTC
From: b3s7a00@aol.com
Topic: 939 Message: 939

Hi Im tony schulte KC0lnd in eden prairie MN.
I am sort of new to the mail list, but from what I can tell, it is a great palce for discussion. Anyway, I joined a few days ago to gather info on hexbeams, and thier performance. I recently made a trip to the hardware store to get the parts for my first Hex beam homebrew antenna. I am using 10 ft 1/2 inch TW PVC for the element spreaders, and a piece of plywood for the hub. I have it all framed up, and have yet to install elements. weight is 20 lbs. I have a few questions reguarding the project...
1. Will a TV rotator beable to rotate a 25-30 pound hexbeam? (weight estimate allows for snow, etc.)
2. is there a way I can tune it with few special instroments?
Thanks for any response.
-Tony

Hi Peter,
I am in the Central Time Zone (CST) and still saving daylight (CDT).
The "Z" stands for ZULU which is the same as GMT, UTC, ...

I have had additional input about times. It has been suggested that
we not have a specific hour, but listen/call on 10 minute slots on
the different bands.

The following is the proposal.

10 m On the hour
12 m 10 min. after the hour
15 m 20 min. after the hour
17 m 30 min. after the hour
20 m 40 min. after the hour.

Frequencies remain the same.

Please let me know your thoughts. EVERYONE, please let me know if
you like this approach or not, ir have another suggestion. Either
send direct email to me or post it.

Tnx es 73,
Barry - W4WB

My thoughts are that if the pool of Hexbeam users are looking over different hours the likelyhood of finding others is reduced. I would prefer a specific time or perhaps just 2 different times.

I had a listen today on 21356 and 18156 and got no replies to my calls. I have to yet to work anyone with a Hexbeam (except P5 but he was on his vertical!)

73 de Eric G0CGL.

Internationally, you're in Sierra time zone, Barry. Central may not mean much to those on other continents.
de Nigel G8IFF

Time zone letter abbreviations
The basis for this is Z - Zulu time - Zero meridian time - the same as UTC
It's a convention to assign letters to time zones, where Z= Zero meridian, and Zulu is the word that represents the letter Z, when it's used in communication. It is sometimes used in the US Military and NATO in conjunction with 24 hour clocks, and is also popular to use in movies to reference time.

Other letters/words are used for other time zones than UTC, most based on the right or reverse order of the Alphabet, although 'J' is skipped ('J' refers to current local time of the observer) (there are 25 time zones defined here, but 26 letters in the alphabet), Zulu is an exception to this, in the middle, here from the International Date Line, going west, until the International Date Line is reached again. Letter Word Difference
Y Yankee UTC - 12 hours
X Xray UTC - 11 hour
W Whiskey UTC - 10 hour
V Victor UTC - 9 hour
U Uniform UTC - 8 hour
T Tango UTC - 7 hour
S Sierra UTC - 6 hour
R Romeo UTC - 5 hour
Q Quebec UTC - 4 hour
P Papa UTC - 3 hour
O Oscar UTC - 2 hour
N November UTC - 1 hour
Z Zulu same as UTC
A Alpha UTC + 1 hour
B Bravo UTC + 2 hours
C Charlie UTC + 3 hours
D Delta UTC + 4 hours
E Echo UTC + 5 hours
F Foxtrot UTC + 6 hours
G Golf UTC + 7 hours
H Hotel UTC + 8 hours
I India UTC + 9 hours
K Kilo UTC + 10 hours

L Lima UTC + 11 hours
M Mike UTC + 12 hours
International Date Line is between
time zones M and Y (24 hours/one day differs)
The letter 'J' for 'Juliet' is used to refer to local time of the observer.

Hi Dave,

Of course some of use CW and PSK and RTTY and FM and SSTV and ... :-)

Would you like to set some times & frequencies. Doug has suggested some CW freqs such as 28.056.

Please let me know your thoughts.

Tnx es 73,

Hello Barry:

I am an interloper on your hex-beam group as I am not an owner. However, I am in the process of evaluating the hex-beam as an option. Consequently, I've been tuning to 256 quite often, but haven't "connected" yet.

I think the idea of a master freq/time is a good idea. So many options spreads people out too thin with the result that it is more unlikely to get hooked up. I like the idea of starting on 10 and then moving to lower frequencies on a fairly rapid time frame, that makes sense to me.

But since I am not the proud owner of, etc., why the heck am I voting?????

962. my HXL-1510

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-09-23 21:39:42 UTC
From: Peter
Topic: 962 Message: 962

Hello all,
Thought I should post the story-so-far with my HXL-1510, which is Traffie's leight-weight 21/28 MHz dual-band version of the Hexbeam.
Having moved QTH about a year ago, I started playing with indoor wire dipoles for the higher bands. Last winter I began looking for a more permanent setup. Living close to the North Sea, I became aware of the high winds at my QTH. So I needed something not too big, not too heavy. Searching on the Internet, I finally came across Mike Traffie's site (and this newsgroup). After making some considerations about size, costs, and the frequencies I wanted to have a decent antenna for, I decided to buy the HXL-1510, and try to extend it with wires for 12 and 6 metres.
Having ordered the antenna by telephone, it arrived a week later. Assemblage was very easy, taking little more than an hour. Now the antenna was in my garden a couple of meters above ground on a small mast. First attempts looked quite promising, it certainly didn't perform worse than my wire dipoles, which were much higher.
Then I started trying to extend the beam with wires for 6 and 12 meters. I didn't want to abuse the antenna too much, so I used the nut bolts for 10 and 15 to also hold the wires for 6 and 12. Adding 6 meters proved to be very easy. I noticed the lowest SWR frequency for 10 and 15 moving up a bit, but operating 95% SSB on HF, that was no problem. After some cutting, I found a good length with very low SWR on the lower part of the 6-meter band. Much encouraged by that, I started to attach wires for 12 meters on the beam. This proved to be a mission impossible. I couldn't get a low SWR on 12, and the frequency with lowest SWR on 15 and 10 shifted dramatically. After some tries, I gave up and decided to choose performance above band coverage.
Now it was time to wait for weather good enough to put the antenna on my roof. At last, May 27th, was the day. My brother Hans, PE4HB, was willing to do most of the "dirty work" and at the end of the afternoon it was time to attach the coax to the rig. First hearing was bewildering! Especially 15 meters was MUCH stronger than the wire dipole. Also 10 meters certainly wasn't doing worse, and the local beacon on six meters that I previously had heard just outof the noise, came screaming through the loudspeaker. You can't tell how satisfied I was.
Since then, I have been working a lot of dx-stations. Although the summer months haven't been the best for dx, my country score has improved from just over 240 to 270.
On 50MHz best DX was a PY on CW and TR8 on SSB; other new countries were A45, JX, CN, FP, 5B4 and ZC4. On 28Mhz I could add 9L, 9N, TN, YA, HK0, A71 and XU.
The best band sofar has been 21 MHz with new ones like TN, S21, 9L, YA, FR/T, CY9, 5W, 9Q, A71, ZD9, T8, HK0, XY, 9N, 3D2, VK9N, and XU. All worked with a barefoot FT-920 and the hexbeam.
The beam is also tuning on most other bands, but performance on 12, 40 and

80 is poor. 20 and 17 are fair. VK9LO (Lord Howe) was worked on 20 for a new one !
Have been working also a couple of other Hexbeam-users: the CY9DH-expedition and also Mike, N1HXA himself. Still looking for other contacts; always willing to try a sked, and I also will try to monitor the net-frequencies on 15 and 10 meters.
Last catch was P5/4L4FN on 15 meters RTTY, Friday last week. He is also using the HXL-1510 and came back on first call. What started as a 599-599 QSO, took a turn when I wrote him "also using hexbeam here". Ed turned the beam a bit, became even stronger and told me he was very happy with the hexbeam. After some chatting I let him carry on. It was great to have a longer contact with the world's most wanted.
You probably notice there's a happy dx-er here. The hexbeam is certainly the best HF-antenna I ever had.
73 to you all, Peter PB1TT.

964. Potential buyer question

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-09-23 22:57:23 UTC
From: ab0si
Topic: 964 Message: 964

I hope you don't mind a basic question (or three):

1) How badly can an idiot (moi) screw-up the assembly? Their 'net site seems to indicatate that there is no tuning needed. Is that really true?

2) When the north winds blow and the ice on the hex-beam makes something go snap...
a) what is the warranty situation? Length? Coverage? etc.
b) How good/bad is service (timeframe for sending parts; cost of same)

If it makes a difference, I am looking at the 5-bander to be mounted on a 50-foot tower.

Many thanks & 73

Paul (AB0SI)

Yes Paul, the Hex-Beam is very easy to assembly and needs no tuning.

It stands up well in really bad conditions. Chuck used it at the
Bouvet Is. operation (snow, ice, subzero temperatures, winds over 100
MPH, etc.) and worked FB. If your environment is worse than Bouvet,
then please let me know where you live and I'm staying clear of it!
hi hi

Look at the web site for the warranty or call Mike at 888.599.2316.

I believe everyone will agree that the service is excellent.

I like it better at 40', but you will be very happy with it at 50'
too.

Barry

Many thanks for the quick and helpful response. May I ask why you like it better at 40 ft (compared to 50)? Something about radiation angles?

Paul AB0SI

Ok, it's not THAT bad in Minnesota. :)

Hi Paul,

The Hex-Beam is optimized for about a height of 40'. On 20 m, you have a single elevation lobe. When mounted on a 50' tower, the antennais about 55' AGL. The lobe splits into two lobes. The lower lobes has a lower TOA, the upper lobe has a high TOA, and a deep null appears between them. At the last Field Day, I had a HX-5B on a 50' tower. Since the density of stations was very high and we were one of the "popular" stations to work (K 4 Big Fat Turkey), I could observed the behavior of the antenna. For example, I would be working 1's and 3's but almost no 2's. As the skip would change, stations work would change to 2's and VE's. Same effect to the north and west. Yep, the null showed up. I also note that most top DXers have a beam at 40' and use it for most contacts. They frequently have additional beams at say 65' and 90' to cover the range of TOAs. Further, the lobes of a Yagi behave about the same as the Hex-Beam.

Paul, there are many users on this Group that have their Hex-Beams at various heigths and conditions. They all work, but differently because of the installation. From what I know, we all really like our HBs. At some pint, I hope to mount mine on a 50' crank up tower that will be motorized so that I can adjust the TOA to some degree. Necessary? No, but it might be fun. :-)

If you mount a HB on a 50' tower, you still will be very pleased.

73,
Barry

968. Height off surface/ground?

I may have asked this before but what are the suggestions if I want to mount a multi-beam on a pole which is in itself at the top of a 14 floor high rise @ 180ft approx. What is the minimum height of the pole mount? What sort of effect will the roof surface have (I think it is concrete with reinforcing bars)?

Is it possible to have a Hex for 40/80m close to the multi-beam and if so how close can they be spaced?

From: dl7io
Topic: 964 Message: 970

This antenna is not designed or optimized for any height.
I'm sorry but it simply not true!
The antenna is designed to play with a good SWR and an acceptable gain and F/B ratio, like every antenna. If you are looking for the height you have to do it for every of the 5 useable bands. Conditions of TOA etc. will change between all those bands. Don't look on 20m only. By the way, 20m and 17m are the only real good bands for a 5 band version. There you have the best gain and best effect compared to your competitors. As higher the band as lower the gain and as harder the competition. On 10m/12m it is not much better than a dipole and you often will have to call more than twice... We are talking about the 5-band version! If you made the mathematics right your modelling will show you the same results. I made my beams for travelling and I never had the expectations like sometimes described in this forum. While comparing this antenna at various heights (CRANK UP TOWER!) to my yagis fixed at 30m I never got bigger DX signals from the Hex. And I have 3 times more coax on the yagis. So to let you know I'm not in the situation of small place or neighborhood with restrictions. I've 2 x 30m towers with 5 ele monobanders for 10/15/20 and 3 ele for 40m. Another 5 ele for 20m at 12m height etc. I'm using the Hex for the 2nd multistation.
Even compared to a 3 el. quad at 12 ft to a Hex at 40 ft, the Hex (original Traffie beam!) wasn't better.
Of course it was not better because it is a compromise 2 element beam! A 2 element yagi gives you more gain not talking about a quad...
So please everybody be so kind and don't tell us those tales about the Hex. There are some physics we can't change.
It is a great antenna for the place needed, the weight etc. but it is not a mystery.
regards Holger

"So please everybody be so kind and don't tell us those tales about the Hex. There are some physics we can't change".

I'm sorry but I read this and re-read this and thought long and hard and I just cannot understand the comment. Now that 12 & 10 have opened after the summer doldrums I am everyday amazed about the Hexbeam performance on those bands just as I was with 20/17/15 after I put it up in July. And mine is only 25ft up - and I'm in a valley.

Yesterday I worked barefoot Jim Smith VK9NS on 10m with 3rd call in huge pile-up. Why can't I tell that tale to the Hexbeam Reflector?

Eric G0CGL.

Topic: 964 Message: 974

Right-on Eric. Perhaps Holger has a magic dipole for it to be as good as a Hex-Beam. I'm sorry to disagree with Holger, but the 10 and 12 m bands on my Hex-Beam perform quite well and a comparision to any dipole I have ever had having equivant performance, is simply silly. Yesterday I worked the C9 DXpedition on 12 m in a huge pileup. Got Babs on the 2nd call. Heading for her was about due East from here. I had the beam pointing NW when I saw the spot and could not hear anything except the pile. When I turned the HB in the proper direction, she became a solid 55 to 56. Nice! Not bad for something that is "nothing more than a dipole" now is it?

And I might point out that Ed (P5/4L4FN) is using the 10 & 15 m Hex-Beam that a group of us sent him. Ed has been on 10 m recently. Before, he was using the Butternut vertical. Check the comments on the spots listed on DX Summit about how much stronger his signal is now. He is reporting comparitive signals to the vertical of 2 S-units or so better. He is also enjoying the nice null the Hex-Beam puts the JAs into when he is trying to work NA or the F/B it has when trying to work EU stations (F/S also helps to attenuate NA stations). Not bad for something that is "nothing more than a dipole" now is it? Opps, I already said that didn't I? ;-)

Please tell your operating stories and experiences in addition to the technical issues.

73,
Barry - W4WB

Barry,
since 2000 I'm experimenting with the design of the reflected W. It came from the Moxon beam and went via the reflected M to the hexagonal shape or reflected W. One can find first describtions of the hexagonal size from British HAM's back about 20 years or so. In April or May 2001 I had my first 5 band version playing well. So far I build 3 of them. In March 2002 I made the first multiband beam with coax feeding between the elements. In May'02 I got the Traffie HX5B from passed Fritz (DL7VRO) for testing. Here was interesting for me to compare it with my own beams. And we have another HX5B from Traffie at DL7UCX together with the announced quad. He build this quad himself because he was not satisfied with the performance (gain! not F/B) of the Hex especially on 10/12m. And I can confirm this with my simulation results. Because he has no tower for the Quad yet he has it at about 4-5m. His Hex is now at about 14/15m. And it is not performing better.

Again it is a very good antenna for it's size etc. But it is only a 2 element beam and for radiating it is a compromise not the optimum.

There is a very nice effect resulting from the very close installation of the elements. The elements are coupling over the magnetic field. This make it very quiet compared to a noisy yagi or vertical and one can hear more signals especially in city limits. But please this has nothing to do with gain. It is the same effect like known from magnetic loops.

I like this kind of antenna very much! And I use it for DXpeditioning because for me it the best decision concerning gain, weight, size etc. I'm sure I spent more time and money on this antenna than most of the members of this forum. If you ask my wife she will tell you that I'm married with my reflected W beams. ;-)

But I don't like the stories about wonder antenna, better than 6 element yagis etc. If somebody has to decide what antenna to buy, he should know that we are talking about a 2 element beam. Otherwise he will expect something playing like 5-6 elements and will surely not be satisfied.
Holger

@Eric
congrats to your good result. I made my first 200+ DXCC's with a W3DZZ and 50w. The antenna was about 7-8m high in the backyards and the surrounding buildings were about 25m high. Stories like I worked someone somewhere in the x. call are not use- or helpful in this discussion. Let us say you are an experience DXer Eric and you know how and when to call. Otherwise tell me any reason why a folded 2 element should be better than another 2 or more element beams!
A single band reflected W or Hex has about possible 6.5 dBi gain, a dipole has some 2.2 dBi (free space no losses).
In a multiband version (let's say 5 bands) you get about 6 dBi for 20m and 17m but as higher the frequency and as closer the wire elements come together as less you will have. At 10/12m you will have about 4 dBi. Now you can choose in your design one band of the 2 with more gain, let us say about 4.5-5 dBi maximum but than the other band has only about 2.5-3 dBi. I spent most of my time optimizing 10/12m in the multiband version. The influence between the wires is very strong. They are to close and if you cut just 1cm from one element you can also lose the other band. Of course you have F/B or F/S ratio but you have not much gain. So check your installation and look also for other reason why the other antenna is so bad...

@Barry
Please don't bring the 10/15m version in this discussion. This is an absolute other antenna. I'm sure you will have 6 dBi on both bands. There is enough distance between 10m and 15m. And on the other hand, be careful while comparing with his Butternut. What is the efficeny of his Butternut and how looks the direct environment on the roof? How many radial he has?
You really played me the ball, Barry. At my Berlin flat I do have a Butternut on my roof to. It comes with 60 radials of 10-40m length. I have an A4S cushcraft beam at about 7m over the roof and another 7 m tower with...
The house is 11 floors high. The roof is about 144m x 12m. The only directions where the beams are performing better is looking to the smaller side. While they are looking to the longer side the Butternut is the better antenna. And for receiving the reflected W is the best but this is because of the otherwise S5-9 noise on the bands.

While travelling around I always have a Butternut and a reflected W with me. And I also have about 2 S-units difference over the Butternut with the beam at about 8m. But than I only have 10-15 radials mostly about 10m. So the efficency of the vertical is bad and often people have the same conditions at their home installation.

Again for all of you. I love this antenna. And while sitting with HAM friends at the club or somewhere I always come to this theme. Meanwhile many of my friends also want an antenna like this. Not because they read or heard from someone but because I infected them.

regards Holger

"Stories like I worked someone somewhere in the x. call are not use- or helpful in this
discussion".

Simply not true as evidenced by emails I receive from prospective purchasers who have found comments from all those who have expounded the virtues of the Hexbeam on here as an enticement to getting one themselves.

Further, isn't it good to just revel in the enjoyment of using such a well performing antenna and to share that with others?

From your eHam scoring of the Hexbeam 16th May 2001, I see you are consistently biased against the antenna.

Less insolence and more charity please Holger.

Eric.

@Barry
Please don't bring the 10/15m version in this discussion. This is an absolute other antenna. I'm sure you will have 6 dBi on both bands. There is enough distance between 10m and 15m. And on the other hand, be careful while comparing with his Butternut. What is the efficeny of his Butternut and how looks the direct environment on the roof? How many radial he has?
You really played me the ball, Barry. At my Berlin flat I do have a Butternut on my roof to. It comes with 60 radials of 10-40m length. I have an A4S cushcraft beam at about 7m over the roof and another 7 m tower with...
The house is 11 floors high. The roof is about 144m x 12m. The only directions where the beams are performing better is looking to the smaller side. While they are looking to the longer side the Butternut is the better antenna. And for receiving the reflected W is the best but this is because of the otherwise S5-9 noise on the bands.

While travelling around I always have a Butternut and a reflected W with me. And I also have about 2 S-units difference over the Butternut with the beam at about 8m. But than I only have 10-15 radials mostly about 10m. So the efficency of the vertical is bad and often people have the same conditions at their home installation.

Again for all of you. I love this antenna. And while sitting with HAM friends at the club or somewhere I always come to this theme. Meanwhile many of my friends also want an antenna like this. Not because they read or heard from someone but because I infected them.

regards Holger

he should know that we are talking about a 2 element beam. Otherwise
he will expect something playing like 5-6 elements and will surely
not be satisfied.
> Holger
>
Hello Holger,

Do you really think anyone reading this list doesn't know the Hex-
Beam is a two-element wire beam? I should think this is hardly a
problem.

Who is calling the Hex-Beam a "wonder antenna" and saying it is
better than a big Yagi? If one has a 5-6 element Yagi and compares
it to the HB, then this Yagi will win under like conditions IF the
Yagi is properly tuned and maintained. I know one fellow that just
wasn't getting the performance from his big Yagi that he figured he
used to get. When he took it down, it had broken parts and needed
serious maintainance. His losses were BIG. Worked FB again once
repaired.

The purpose of this list is to have a forum to present and discuss
ideas and experiences about this antenna. Perhaps you may not like
others opinions or observations, but that's life. All members are
welcome to offer or ask what they desire.

You have mentioned your modelling of the Hex-Beam. Would you like to
share your model data file with the group so others can run it too?

Tnx es 73,
Barry - W4WB

Hello to all:

Hey...it works for me! Three days ago I had a short but very clear QSO with Ed (P5/4L4FN) and it was HB to HB. He was 1,000% pleased with his antenna and said all kinds of nice things about it. He was 59 in Los Angeles and I was 56+10 with him...not bad for poor old me with the antenna 8 feet above the roof and only an Ameritron 811H amp.

Perhaps we need to be sure to compare apples to apples during these exchanges. Maybe (?) if I owned 40 square miles of property near Los Angeles or the nearby mountains I could have an antenna "farm" with lots of towers, etc. But I don't! Having tried a Gap vertical and a TGM hybrid mini-beam, the HB wins out.

Hi Barry et al

Re HB Performance:

I don't know about all the "Technical" talk indicating that the Hex is little more or less than a Diople.

I was just singning with a UK station, when Chris G3NAE called in to report that my Barefoot signal, was outstanding 5&9+ & flattening everything on the band!!!
Imagine my surprise, I have never had such a report before, even with a multi element trapped Yagi at 50ft. My Hex-Beam #147 is only at 27ft.

Chris was using his 20mtr. Quad mounted on his Vehicle. I recently visited with Chris and saw his Quad, which he can mount on the vehicle in 10 minutes.It is a sight to behold.

Happy Hunting to all "Hex-Beamers", they are the answer for those who are not blessed with forty acres or so. Those Big Gun Stations will always win, but we can at least join in the fun as well.

Thank you Holger for sharing the solid facts about the physics of the hex-beam.

I am considering to build a hex myself (or some simmilar antenna).
It is good to learn some facts you wrote about it - the real gain on the upper bands, the difficulty with the tuning, the reasons for low noise reception, performance at low heights, etc.

So far, the worst I learned about homebrewing this antenna is the difficulty with the tuning.

I also like to hear the success stories with the hex, and hope I will have mine to tell also.

From: dl7io
Topic: 964 Message: 988

Hello again,
I hope we can come to a final with this discussion. But while you are asking for the details... the last posting at eHam.net in Product Reviews concerning the Hexbeam was comparing a 6 element monoband yagi for 10m (at about 20m if I remember correctly) with a Hex (I guess also 15/10m version) at 9m. And the Hex performed like his yagi for DX. And again this Hex will have some 6dBi gain maximum. That means if the Hex is like his yagi this is not because the Hex is so good. He should check his yagi because there will be something wrong with it! And this was one part of my message. One can find a few more stories sounding like this here and somewhere else. I'm sure Paul and other potential buyers are reading most of the content in the message directory here and postings from other sources like eHam.net etc.

If the impression is that the Hexbeam performs much better than what he had before and the difference to the other antenna is bigger as we can expect from a 2 element then we have 2 conclusions:

1. The Hex is a well designed antenna. So in case of a commercial one Mr. Traffie made a good job!

2. The antenna used before needs to be checked for the installation conditions and/or design. Or in other words the old antenna is bad performing.

But you never will find the second conclusion written in the postings! If a potential buyer reads postings with comparisons like this without the conclusion: "my old antenna is bad performing" he can get the impression of a wonder antenna.

I'm sorry for confusion or misunderstandings because of my poor English. In fact I love this antenna and I spend most of my time for it.

My last comment on that: I would highly recommend this beam to potential buyers with limited space, sensitive surrounding or DXpeditioners. But it is a 2 element beam and 6dBi is the maximum gain you can get!

Holger

PS.@Barry, will send some files shortly. What program are you using? I will be happy if someone else will have a look on it. It is difficult to model multiband versions and I'm always afraid of mistakes in the model.

I heard Barry W4WB in the massive pile-up for ST0F this evening and he was easily the loudest North American calling, in fact the loudest period. Guess you made the QSO Barry.

Since William runs only 30 watts from Khartoum, I tried with 30 watts too - it took quite a few calls and about 15 minutes but I got 5/8. Not bad I think.

Hi Paul,

I think Holger has addressed the "wonder antenna" in a following email. Actually, if I had the space for stacks of say 6/6 or even 4/4, I would still have a Hex-Beam as part of the antenna mix. :-)

FWIW, I know several fellows that have/had the C3SS and have switched to the Hex-Beam and contend the HB performs better. One fellow on EA8 had his C3SS swinging over into his neighbors yard and that was causing a problem he said. Some months later I worked him again and he had the HB and was very happy (and so was his neighbor I gathered). I simply note that both times we had a QSO, he had a great booming signal. There seems to be a pipeline to EA8 from my QTH. Often have rx 59 rpts running QRP with the Titan vertical. Sure wish I could move this "pipeline" at times! hi hi

Hi Eric,

Sadly, I didn't make the contact today with William. He was only 42 to 52 here running his 30 W. That put me roughly at S-4 to S-5 there. He was hearing many EU and G stations at 57 to 59+ so I was underneath you guys. The only time we in NA appear to have a chance is when he lsn for NA stations only. Maybe tomorrow. :-) He will be there a while and is getting a KW station and a tri-band beam I understand. [I did get at least an EX on the first call with a 58 rpt for a third band.]

Congratulations on your contact. Also, thanks for the nice signal report. Good demonstration of the power of propagation. hi hi

From: reidserv
Topic: 993 Message: 993

Been looking at the hexbeam since I saw EI7BA John Tait's post on the Internet. So, I tried a 17m version myself, last night. I used six skinny lengths of 8-ft bamboo mounted to a 2-ft circle of 5/8ths plywood, strung it with #22 enameled wire, and fed it with RG58 coax. I used the formulas that John e-mailed to me, complete with end-of-element spacings. Stuck it up about 24-ft; didn't bother with pruning, just tuned the tuner for low SWR. Pointed it slightly N of East from my QTH in Boise Idaho, and answered a phone CQ by K0SRI with 100W from my IC-730 at 0238 UTC. She said I was "coming in like 'Gang Busters', 10-over-9" to Minnesota and to "keep it up". (BTW, my first YL contact - X or otherwise - since becoming a Novice in 1969, and my first ever on SSB. Thanks Maryann!) Coulda been good band conditions, and I've never used a beam before; but it sure seems amazing that something this small acts the way it does. GO, Hexbeamers!

Try DX4WIN, LOGIC, or LOG WINDOWS. They all have this feature, but
you must pay a small fee for them. This is a real business for each
of these companies and it is good to support them I suggest.

996. tool for getting a model

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-01 13:23:30 UTC
From: dl7io
Topic: 996 Message: 996

Hello all,
I have uploaded an excel file which is in my opinion more helpful than model files. The model for a multiband array is very complex and has more than 50 wires. So without this tool it is almost impossible to change anything and to know what you have done.

This excel file is calculating the X / Y / Z data for the model. No matter what program you will use. You can change the wire length (length per leg --> 2 legs per radiator or reflector element), the isolator distance and the distance from the center hub. All data are in centimeter (cm) but you can change it to feed.
Sheet 1 is for a single band version only.
Sheet 3 is for a multiband array.
Please do not use Sheet 2. There are some mistakes in the formulas. This was made for modelling a beam with one common feeding point for all elements. But I was not able to get useful results and did not continue this project. That's why I never corrected the mistakes.

The only thing you have to do by yourself is the feeding system. And here is the point where in my opinion most of the mistakes are possible. I don't trust my own feeding system model. So I decided to give you the excel file first and may be we can compare the part with the feeding of the model. While you are going to simulate the beam with the low impedance line take the wire lengths out of my .ppt file. The actual values in the file where used for a model with coax cable feeding between the radiators and from the bottom (mounting plate).

The best results are with a NEC4 machine. Programs based on Nec2 like EZNEC3.0 or Nec4Win have problems with closed wire elements and you have to check the results carefuly.

@Peter - logbook program
I'm using UCXLog. It is freeware and has grey line and rectangular maps with the path and beam headings to the other station. It does not need any installation setup and will not write dozens of .dll's on your harddisc or write in your registry. But it makes CW, you can run SSB via soundcard if you like, DX-Cluster via Packet, Telnet or Internet, QSL-printing tool, file import/export etc. etc. And it is both contest and logbook program.
You can download UCXLog version 4.08 from the bottom of this page:
http://www.funkstation.info/portal/html/modules.php?op=modload&name=Downloads&file=index&req=viewdownload&cid=1

Hi Folks,

I have had a number of you comment that the lack of a really specific time to check the Hex-Beam frequencies is not working out. I also have asked for specific suggestions, but haven't rx any.

OK, thinking about propagation and such, I changed the times to 1800 UTC and 2200 UTC plus the minutes offset by frequency every day. Perhaps Saturdays might be the prime day.

Any comments or interest?

Tnx es 73,
Barry = W4WB

Barry:

Once again, you have demonstrated why you are known as the OWO (Old Wise One).

The suggested times and the offsets for each band make sense and should be tried. After all, if they don't work, we can always blame the OWO.

Regards, 73, and all that ham stuff,

Herb K6HJM

Hey Tom,

Interesting comments. The one by "DocRF" where he states that Mike "copied" the Hex-Beam from the reversed (opposed) M-beam indicates to me that he has trouble with basic geometry. The Hex-Beam has 60 deg angles while the M-beam, etc. don't. It makes a difference. Mike states that he came up with the configuration on his own. I would like anyone that knows where a "hex-beam" is documented that preceeds Traffie to kindly provide a reference.

From: ab0si
Topic: 1006 Message: 1006

Greetings.

I placed an order for the Hexbeam 5-bander yesterday. (aside: friendliest phone call I have ever had). I also ordered the telescopic pole as a temporary resting place for the hex-beam until the city blesses my tower. (After that I will use the pole at my second QTH). It will be mounted in a sleeve and the sleeve planted in ement.

A few newbie questions for the ehlpful folks in this group:

1) Is a Channel Master TV rotoar good enough or should I go with one of the smaller "ham" rotors? (please remember, that this is not a heavy dury or permanent installation.)

2) I have no idea where to purchase guy anchors/stakes or whatever they are called. Where can I buy these?

3) Should I guy with wire or rope?

4) What else has my feeble mind forgotten?

Thanks e 73

Sure. Get one with the degrees on it if you can.
>
> 2) I have no idea where to purchase guy anchors/stakes or whatever

ACE Harware or any mobile home supply place.

>
> 3) Should I guy with wire or rope?

Never wire. Suggest the rope by Synthetic Textiles. AES carries
it. Great stuff.

>
> 4) What else has my feeble mind forgotten?

Coax and a balun. RG-213 is fine. Get 6 to 8 Type 77 ferrite beads
and locate below the base of the Hex-Beam (never above). Contact me
if you need to locate them and how to mount them. Also, get some
cable ties to secure the coax to the center post of the HB and to the
mast. There are three wrong ways to bring the coax from the HB and
one right way. It is shown in the manual.

I am homebrewing a hexbeam, and I was not aware of any specific ways to feed it. Is it anything that you could clue me in on?

-Guy anchors....
I used some 48 inch bu 4 inch steel augers I purchased at Manards for guy anchors, and a 48 inch fence post anchor for the base (all of this costed under 10 bucks). I guess it wouldnt be a bad Idea to use rope, but I am using stranded steel wire for guys. I am insulating it at the tower, and at the stakes to prevent an unintentional ground plane (would eliminate the benifits of a tower)

-Coax
well, I purchased 100 hundred feet of rg8x on ebay (I thought it was rg8!), and am feeling sort of dumb. will the losses be great enough to justify buying more rg8?

Why Type 77 ferrite beads? I assumed Type 43? This is mere curiosity
in the hopes that I might learn something (banging skull agaisnt wall
to force access to brain)

Thanks

Thanks for the suggestions on guying.

8x is fairly lossy stuff. (1.9 dB at 28 MHz compared to 1.2 MHz for 213 and 0.64 for 9913 -- all per 100 ft).

When I called Traffie Technology (makers of the hex-beam) and asked about a balun, I was told it wasan't needed. They did suggest ferrite beads, though. Barry here suggested using both.

Correction..... Barry recommends the #77 toroids in lieu of a coax balun. These are slid onto or clipped over, if you use the split version, the coax just below where it drops below the aluminum hexagonal base plate. It you use the split type with the nylon-looking cases, clip off the tits that grab the outer jacket. Secure them in place with a couple large UV-resistant tie raps below the lowest one. If you do not the tits will, over time, penetrate the jacket and expose the shield to the elements. Those who have not yet found the #77 toroids use #43 or whatever we have been able to find. Their purpose is to keep RF from flowing on the outside of the coax's shield and some materials do it better than others. Barry, the OWO, being the engineer that he is has found and is using the optimum mix. The prefered coax is the best 50 ohm type you can afford. If you expect to run high power definitely do not use RG-8X.

Tony,

Yes, this has been discussed in the past and is in the archive. In short, run the coax between the reflector and the driven elements on the shield side.

Trust me, don't use guy wire even playing the non-resonant length game.

Re. the coax, get some RG-213 and be happy. It is only $40 or so per 100 feet as I recall. The coax you purchased is an excellent attenuator. ;-)

Paul,

Sorry about the clarity of my reply. Sure meant the Channel Master.
I used one with FB results until recently when I change to a CE-45-II
because I need to have the rotor under computer control.

The frequency performance of ferrite beads is strongly dependent upon
the material composition used. Type 77 (or 73 or F) is best for the
HF amateur bands. Type 43 is best for the VHF and UHF bands. In the
VHF spectrum, they are roughly the same. In the speech compressor we
market under W4RT Electronics for the FT-817, we use a mixture of
Types 43 and 73 beads since teh FT-817 covers 160 m to 70 cm. Since
the Hex-Beam is HF only, Type 73 is preferred IMO.

73,
Barry - W4WB

Paul,

There are baluns and there are baluns. I expect that what Traffie was discussing was the impedance conversion type, i.e., say 30 ohms to 50 ohms. This is not what I am talking about.

The balun I am suggesting you use is to eliminate or at least mitigate any current flowing on the outside of your coax shield (stops that nasty radiation and pickup by the coax). You can solve the problem various ways. One way is to make a simple 1:1 coax balun comprising a modest number of turns of single-layer coax about 4+ inches in diameter. It should be located just under the base of the Hex-Beam. This works, but has limited bandwidth and is somewhat fussy. A better way is to use ferrite beads bunched together and held in place just under the Hex-Beam's base plate. Type 77 is the best. Type 43 will work, but is not nearly as efficient. The beads I use are cylindrical with a 1" o.d. and slid over the RG-213. My balun has 8 beads and is held in place with heat shrink and a cable tie at the top and bottom of the balun. The beads I found are not made presently in 73, but 77 is essentially the same. The results compared to the coax balun are quite evident.

To be clear, don't use the coax balun and the beads. Just one, and I suggest the beads. I suggest that you read Walt W2DU's nice book called "Reflections II." You will learn more about SWR that you may care to do. ;-)

If you need a source for these beads, let me know.

1016. Hex-Beam vs. Qaud?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-09 05:21:33 UTC
From: st_christobal
Topic: 1016 Message: 1016

Hi all,

I am contemplating putting up a HX-5Bi at my QTH. But I'm also very attracted to the Lighning Bolt 2L 5-Band Quad.

Have any of you OMs done direct comparisons between these two types of antennas?

As you know, the Quad is *much* cheaper, but requires a bigger rotator and tower. I have neither at this stage.

Perhaps, the way to go would be to get the Hex-Beam with a light mast and rotator. When funds allow, I'll put up the bigger tower for a 4L quad.

I like DX ragchewing, so a good antenna is a must for me HI. BTW, I currently have a Hustler 4BTV on my metal roof (works ok) and a 40m horizontal delta loop.

Any advice will be much appreciated. Thanks!

73, Chris - ZS1DX

Very helpful, thanks again, sir. I buy my ferrite at Palomar
Engineers. They routinely carry 43,73, and 77 in various sizes.

From: w4wb
Topic: 1006 Message: 1018

FB Paul, but beware that (for whatever reason) they seem to push Type 43 for HF. Also, there are also different qualities, i.e., all ferrite beads are not the same (some have failed in short order so I have been told). I don't know who Palomar's present ferrite bead supplier is, but it is worth the question. Amidon is the first-class source; however, there "appears" to be two Amidons. There was an ad in the last couple of months in CQ or QST about this. I suggest that you use the real Amidon. As I recall, the part # is FB-77-1024 and their url is
http://www.amidon-inductive.com/associates_specs_ferrites.htm
(specifications page). Oh yes, don't attempt to glue the bead together, just let them loosely group together. And don't get confused by their balun page, it's not what you want.

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-09 12:14:09 UTC
From: Peter's Mail
Topic: 1016 Message: 1019

Chris,

I used the Lightning Bolt 2L 5-Band Quad for several years. It was hung atop my tower around 65-foot AGL.

Performance was excellent.
Very quiet
Good front to back
Broad beam width
Very large compared to the HEX
Disintegrated in an ice storm (Hub broke into many pieces)
Lot's of tuning required

HEX Beam

Much better material quality
A great deal smaller
More balanced physically
Not much front to back ratio
Less Forward effective gain
Plug & Play no tuning

I would highly recommend the HEX over the Lightning Bolt. What ever I hear on the bands I can work. With the amp on, I regularly receive reports "you are the loudest signal on the band".

HEX is mounted at the 40-foot level AGL on a roof tower.

Both antennas have given rise to lots of questions from folks passing by but I must say the HEX wins out 2:1 due to its unique physical design.

I live on the New Jersey shore near the ocean - Big winds - no issue with the HEX

Barry,

Are you still using the #43 from All Electronics? Or did you change them out? I want to get up on the tower before winter sets in and place some ferrites on the feedline. I have many of the #43 on hand.

Hi Ren,

I got a number of Type 43 from All Electronics (cheap), but I never really used them. I had a 12-bead balun on the coax at the bottom of the mast (doing little good) just waiting to drop the antenna, remove the coax balun, and replace the rotor. In the meantime, Amidon finally got the needed Type 77 beads back in stock (not cheap) so I ordered them and used them instead when we dropped the antenna down a few weeks ago. All RFI issue with the company phone system are now gone. The Type 43 is about 1/2 or less effective on 20 m as the Type 77, so add more beads. My Type 43 balun has 12 beads (using it on the Titan vertical now).

I am sorry that I started (or aided) the discussion regarding Barry as the "OWO". I appear to have made a mistake regarding this abbreviation inasmuch as apparently it stands for O Wierd One" based upon the information from Marty (N5NW/8). Sorry about that Barry!

OK...more serious question. Amidon Associates does have the 77 beads but only as non-split rings. However, they do have a new product not yet shown on their web page. It is their catalog # 2X31-181P2, is type 31 material, is a split bead with case, is in stock and sells for $3.50 each. Seems it has the same U value as 77 (2000). Barry..what ya think?

Herb,

I don't want a split bead if I don't have to have one. The Type 77 bead I reference simply slides on the coax. Did I mention that you might have to take off your coax connector and put it back after the beads are on? For a ham like you Herb, that's no problem is it. :-)

As far as the Type 31, I know nothing about it and consequently, I go with what I know will work FB. Try it if you wish and let us know how it behaves.

What? Remove a coax connector? I assumed one just pushed hard and the non-split bead just slipped on...wrong again? It is clear that I will never achieve as high a level of RF-greatness as the OWO.

I should have said ... this is what people mean when they refer to ME as
"OWO" ... :)

Funny, I translated "OWO" as "O Wierd One" ... :)

Have fun,
de N5NW/8 (Marty)
Bellbrook, Ohio

Hi Barry:

How many of the type 77 beads did you use just under the base plate of your Hexbeam. I know you've mentioned it in another posting, but I couldn't find that posting.

I think you said that the type 77 were not split. What do you recommend (Number and type#)of a split bead??

Tnx and 73,

Tom, NØYD "Yankee Doodle"

Hi Tom,

I used eight beads. If you want to use the Type 43 split beads, then I would suggest using at least 12. Doug W6HB has mentioned the problem of using those that have the snap holders and how they may damage the coax. When we made the Type 43 balun, we epoxied the two halves together, but not the beads together.

The Type 77 just slide onto the coax.

73,
Barry - W4WB

p.s. Having fun again DXing now that the space WX has improved.

Topic: 1034 Message: 1034

I am new to hex beams and would like to try building a triband (10-15-20) variety for portable contesting.

I tried looking back through the archives to find a source for the poles and was unsuccessfull.

Can any of you guys that have homebrewed one of these share your pole source with me.

Thanks.

Hi Reggie,

It depend upon what bands you want to operate. The 5-bander, (10-20 m) has a turning radius just under 10'.

Well, for the person that asked about the spreaders,
I am also homebrewing a 20/17 meter hex, and I am using 10 foot by 3/4 inch
thin-wall PVC pipe for spreaders. costing a dollar a piece, and fairly light,
I find them to be a great value.

Condx are still chronic over here in EU I have to say. But I just had my first Hexbeam to Hexbeam QSO - with Tony AD1Y
who is a really nice guy as anyone who has spoken with him will know. So it was a nice contact for me to work him, 5/8 both ways on a poor 15mtrs.

As for DX, only S07L has been notable recently which actually is not too hard from here and a few other Africans like 5H and 5X.

A pleasure to meetup with you again Eric. I'm very glad to give you
your first HB to HB contact. Only 99 more to go (HI)!

Mike mentioned to me that the HB was designed without a balun, so should work fine without one or with one if individual circumstances so require.

Really glad you're enjoying the Hex Beam. Continued success with it!

1042. Considering....

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-12 13:22:07 UTC
From: Jason Hissong
Topic: 1042 Message: 1042

Hi guys,

Stumbled across an ad for the Hex beam and read about it in Eham.net and at the hexbeam site. It seems to fit the bill nicely for me. I am considering the HX5 version versus a Force 12 XR5. I am still considering tower choices. I already have a Yaesu 450XL rotor which would be adequate for the Hex beam. What I like the most about the hex beam is that for a smaller weight and area, I am getting the equivalent to an XR5 from Force 12. At about the same price.

I would love to homebrew a single bander just for grins... are there any details on constructing my own? (I will still be getting the HX5 later)

Also, I was looking over the pictures and I noticed someone had an Aluma crankup. I could not find any prices on their crankups, but that sounds like a nice alternative. What type of prices (including freight) and turnaround time is there on their standard duty crankup? (T135) My current tower choices are Rohn 25G, 45G, Trylon, and Universal. The city I live in will allow me to construct a crankup tower no higher than 35 feet without a variance hearing. I may be able to install a crankup that will go higher, but need to keep it below 35 feet until after the variance.

Thanks guys... I will let you know of my progress on the tower....

Thanks guys for the warm welcome. I just thought of a potential alternative while I was tossing and turning in bed thinking of the work a tower would bring. I really don't want to go through the trouble of putting up a tower. However, I was looking at the HDX-30 mast. I used to have a GAP Vertical in the back yard. So I have a 3 or 4 feet deep by 1 foot in diameter hole filled with concrete and a piece of PVC pipe I used as a sleeve for the rigid steel pipe the vertical was attached to. I also have a Yaesu 450XL Rotor in mint condition I got from a trade. Can I work with this stuff and get me a rotatable Hexbeam in the air? I would not have to go through a permit process as it would be stealth and "temporary". I also have a top section of Rohn tower that would be about 10 feet high. I could get a base and have a 10 foot "tower" where the rotor would sit, a thrust bearing, and the mast sticking out the top. That may work too. For the cost of a tower, I could stack a couple of HX5s up. Does this sound like it may work?

Thanks again guys... if this works, I will be able to do this. My credit card is also ready to be used if I can get this to work :-)

Thanks guys!

Sounds like a plan Jason! My HX-5Bi works well for me at about 30 feet AGL. I am on now if you would to sked and compare notes. The HDX might be a little light for stacking Hexs, but works well with the rotator at the bottom, two tiers of Dacron guys and the Hex on top.I have an old 2-section Triex crank up that I have braced to the eaves and held to 30' for the same reason you are considering a similiar thing. 73 - Doug - W6HB

Should work fine Jason. The HDX-30 mast is a very FB mast. If you would like, I have a pdf copy of the manual I can send to you if you would like to see more about it. You can mount the rotor at the base or at the top. Traffie can work with you to make a rotor to HDX-30 base adaptor.

Look at the home page for this list and notice the photo of P5/4L4FN. Ed has the 10-15 m HB on the HDX-30 mast.

A friend of mine in Guam just ordered the HX-5B and the HDX-30 FWIW.

Hope this helps. Just ask and I'm sure you will get plenty of guidance.

Thanks guys,

I asked this same question on the Tower Talk list and they seem to think that this would not be a good idea. They stated that the mast would not be able to support the Hexbeam in high winds. Also, would the base be sufficient (the one I have for the vertical). From what I understand, it looks like I cannot get away without using guys. What would be the best way to guy the mast? (i.e. what would I use at the bottom of the guys). I would be able to mount the mast to the back of the garage and house (about 15')

I just want to get a lightweight beam up. I think the hexbeam at 30 feet would do better than my dipole at 30 feet.

I may take some pictures of my planned area of installation and maybe you guys can help me with what I may need. I can post the pictures up on the photos area.

The PDF of the HDX manual would be great!! Thanks!

Hi Jason,

I didn't understand before that you were trying to use the HDX-30 sans guys. The HDX-30 or other mast like this must have guys. You should have two sets of guys. I suggest you use SYNTHETIC TEXTILES 350' 3/16" available from AES http://search.cartserver.com/search/search.cgi?cartid=a-6994&category=newprices2&maxhits=200&keywords=synthetic+textiles for the guys. Never use wire guys with this antenna.

You can use many methods to create a ground anchor. At most ACE hardware stores or mobile home supply places, you can find ground tie down devices. These just screw into the ground.

As far as wind survival, I have had no problem in winds at least to 65+ with my Hex-Beam although I have 3 sets of guys due to the installation situation.

Interacts with the antenna even if you break the lengths up as
discussed in the ARRL Antenna Book.

Guys,

Thanks for your recommendations. I talked to the XYL and it appears that she has given me her "blessing" to use a Glen Martin Roof Mounted tower. If I install it on the garage, it will get the Hexbeam up to 40ft. If I put it up on the house, I would get 45ft. Question is, can I install anything above the hexbeam? I will want to install my 2M 11 element beam up there as well.

With this solution, I would not have to guy anything. No concrete or the hassle of digging holes!

My choice is down to the Hexbeam and the Force 12 C3SS. Help me make my decision guys ;-)

Thanks! If I end up getting the Hexbeam, I will definately post my pictures.

Jason Hissong
N8XE

I definately would like to do a sched with someone. Especially doing A/B comparisons with a Hexbeam up at 40 feet compared to maybe a dipole of vertical. Email me direct as it seems that I don't get these messages sent to my email address (even though I have it set to do so... hmmm)

Jason,

Good choiceon mounting. Height is FB. It is not practical to mount the 2 m array above the Hex-Beam unless you use none conductive mast and make a fixture to allow the HB to be offset a bit to allow the other mast to rise up. Hope that made sense. Ask Mike for ideas.

I know a fellow in EA8-land that had a C3SS and talked to me a long time about the HB, made F/B, F/S, etc. OTA measurements. He decided to replace his C3SS with a HB.

From: Makoto Tanaka
Topic: 1055 Message: 1055

Can anyone help my friend who is using HX-5Bi in Western Japan.
He has been concerned about high SWR in 12 and 10 meters (Other
bands are quite OK). He put down his antenna and checked SWR
with MFJ-259 by terminating with non-inductive register in each
element connecting point (prior to this, he confirmed that the
non-inductive register is 1.0 SWR with MFJ-259). Then he measured
SWR at feedpoint, he observed that the SWR above 15 meters increased
say, when he terminated at 20 meter connecting points, SWR at 14MHz
is 1.05 and 1.3 at 28MHz, when he terminated at 10 meter element
connecting points, SWR is 1.1 at 14MHz and 1.5 at 28MHz.
I am not a technical person and not sure if he is doing right thing
(theoretically, SWR should be 1.0 in this case for entire bands?).
Anybody helps me?

1057. HexBeam for 40 meters

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-14 17:17:42 UTC
From: RadioN1IX@aol.com
Topic: 1057 Message: 1057

I am so pleased with my HX5Bi that I am thinking of homebrewing a hexbeam for 40 meters. I am currently using a full wave loop which works well but has no directivity or F/B. I am assuming that I can take the 20 meter dimensions and double everything. Has anyone tried this? What can I use for spreaders? I was thinking of small diameter PVC.

From: Jason Hissong
Topic: 1058 Message: 1058

Hi guys,

Just wanted to post to the list that I bought the HX5Bi today. Called Mike (great guy) and we talked about the antenna. After talking with him, I went ahead and gave him my CC number and I have a Hex beam heading my way this week!

My primary reason for buying it was Mike allowing me to buy it and then return it in 30 days. That makes me feel great about my purchase. Low risk. I was not able to get that kind of service from previous antenna (or amatuer radio vendors in general) Plus, thanks to Doug, W6HB, I was able to get some good comparisons between a similar antenna to my dipole. And it was enough to sell me. Looking forward to keeping you up to date of my progress (on my web site http://www.qsl.net/n8xe)... thanks again guys!!!

1059. Interaction with other antennas

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-16 02:33:43 UTC
From: Jason Hissong
Topic: 1059 Message: 1059

Hello Again guys,

I will be installing the Hexbeam on either a 17.5' or 26' roof mount tower. I was thinking of installing my dipole in an inverted V using the tower as a support for the center portion of the dipole. My question is how much interaction will happen between the hex beam and the dipole? Also, if I want to install a 6 meter (or 2 meter) version of a hex beam, would any interaction happen with them? (I would be installing the smaller beam(s) with a TV rotor on the roof.

Thanks!

From: Bud Mortenson
Topic: 1060 Message: 1060

Hello everyone. I have been reading posts in this group for a long time. It has all been very interesting and helpful. I have been building a hex-style antenna for ages, and I can now share what I did, and how it has worked out.

You will find the complete story in the Files section -- look for the Word (or WordPad) .doc in the VE7ASK folder.

http://groups.yahoo.com/group/hex-beam/files/VE7ASK/

Below, is a summarized version with lots info and anecdotes chopped out. After all, most people don't want to wade through 5,000 words of construction and installation details. I tried to leave enough in to give you a sense of the project, and the results. But the full version has much, much more detail.

Hope this helps someone build a hex, or decide to buy one of Mike Traffie's commercial, ready-to-go models that will work properly right out of the box. I am convinced this is the best antenna for its size, weight, visual impact, cost, and installation requirements.

I will keep you posted as things progress from here.

73, and thanks again for all the info you have provided me since last spring.

-- Bud, VE7ASK

==========

The Bamboo Hex

In 10 Easy Steps (and Several Not-So-Easy Ones)

NOTE: This is a short version of the story. For the whole story, read the document Bamboo Hex.doc:
http://groups.yahoo.com/group/hex-beam/files/VE7ASK/

For accompanying photos, see the VE7ASK folder
in the Photos section of this Yahoo! Group.
http://photos.groups.yahoo.com/group/hex-beam/lst

In March 2002 I started planning the construction of a five-band hex-style beam. Thanks to homebrew inspiration from VK2DPD, DL7IO, AA5HP and others, and Mike Traffie's outstanding concept and pioneering work, I managed to cobble together all the parts and have something that now radiates from just a few feet above the roof.

This is a home-made five-band antenna made from bits of bamboo, some hose clamps, a few wires, and lots of hours of puzzling, building and -- at last -- huge satisfaction.

Please note that I consider this a "hex-style" antenna. I don't want to call it a "Hexbeam" as it is a pale imitation of Mike Traffie's real antenna.

This year, I have been bitten by the contesting bug. G5RV antennas are great for casual operating, but they don't put you in the top half for many contests. I wanted something very cheap with at least a little gain that can be generally pointed at stations but doesn't need a tower (one day, I tell myself). The hex-style antenna met those requirements perfectly.

As the fall and winter contests continue, I will be able to tell if the hex makes a difference in my scores.

Does It "Play?"
==========
Be assured that this antenna CAN be built and WILL work. It is often quieter than my trapped vertical and my low G5RV at 28 feet. It definitely has gain on all upper HF bands, and is quite directional. Front-to-back rejection on my homebrew version is OK, but I'm more interested in forward gain than QRM rejection at this QTH. I figure if I have to worry much about QRM off the back, I'm lucky to have it, hi.

Signals in the hex's direction on 20M are often markedly stronger than on my G5RV, and readability is much better thanks to the lower noise.

Claims Sure to Get Me In Trouble With Experts
==========

After the antenna was on its mast, (Canadian Thanksgiving Day, October 15, 2002), with the 20M element at about 25 feet above ground, I worked SM2CEW and we actually had a CW ragchew in the middle of the afternoon -- the first time in years that I have managed that with a DX station on 20M (me: 579, him: a very solid 599 -- yet Peter was, generously, S-5 with the G5RV). I also worked East Malaysia on 20M. Got him with my first call, before the rotator was plugged in. Down in the mud on the G5RV, but he was peaking S-9 on the Hex.

After installation, the log looks like this:

Date-Z RX kHz Mode Call RST S RST R QTH & Notes

14-Oct 14042.6 CW 9M6AAC 599 599 East Malaysia
14-Oct 14026.4 CW SM2CEW 579 599 Lulea, Sweden 100w hex
15-Oct 18073.0 CW FO0PT 559 559 Moorea 50W hex
16-Oct 14024.4 CW J75EA 599 599 Dominica 100w hex pileup

16-Oct 21023.2 CW FO0PT 559 599 Moorea hex 50w 1st call

Let's try the antenna in real-time. Unscripted. Let me run to the rig and see what I can work on 20M right now (10:20 p.m. local, Oct 16, 2002). Be back in a sec....

OK, took less than five minutes to find and work FO0PT on 14.044 at 5:24Z. That's Moorea, French Polynesia, on three bands in two days with the hex. We were only 559 both ways this time, but made it work -- first call as he changed from simplex to QRX up 1. The hex was only about 1 S-unit over the G5RV for that QSO, which is only a "so what?" if you don't care about S-units.

I have done lots of quick A-B comparisons between the Hex and the low G5RV (doublet, 102 feet). Depending on where the Hex is pointed, I have seen a full 4 S-units (from S-3 to S-7 or more) difference in favour of the Hex. Some signals all but disappear when switching from the Hex to the doublet. And, honestly, some signals are better on the doublet (can't turn it, though).

This may only be a compromise two-element beam, but it really is a dramatic improvement over all the other wire antennas I have built. It's not always exhibited, but when the conditions favor this antenna it is stronger than I thought it would or should be, even at my below-optimum height of 25 feet at the 20M element.

Now, let's get into the construction effort....

Getting the Parts
==========

I actually ended up building three "beta" versions of the antenna, before the present version. The cost of the latest one was (in Canadian dollars):

$24 for the bamboo spreaders (12 x $2)
$18 for hose ("gear") clamps (3/4" for wire points, 1 1/2" for spreader joints)
$ 3 for the hub (pre-cut 1 1/2-foot circle of 1" plywood)
$10 for the U-bolts in hub
$ 2 for the 4-foot center pole (1 1/2" schedule 40 PVC)
$24 for a spool of wire (16-guage speaker wire)
$ 8 for a 400' spool of nylon mason's line
$ 5 for brass screws and nuts
===
$94

All of the above was or can be purchased from Home Depot. In truth, I've spent around $150 on parts, including now-discarded materials for all the failed versions of the antenna.

Things I Tried But Discarded
==========

I tried using 1/2-inch PVC pipe and short sections of dowel to stiffen the PVC for the first few feet, but when tension was applied these spreaders tended to form "S" bends.

I "bend tested" some 10-foot pieces of dowel at the hardware store when no one was looking. They made a bit of a crackling sound at about two feet of arc. I purchased the two I tested (see the previous paragraph), but I didn't want to spend $7 each for six of them only to have them snap when I strung the wires.

Next, I tried using six-foot lengths of thin bamboo stakes -- the "green" painted type from a garden center. Strapped together with hose clamps, these spreaders worked a bit but were still a bit too flexible and tended to arc too much to get the right shape.

Combining the PVC with the thin bamboo didn't work at all, so I started over.

I finally went to much stiffer five and a half-foot lengths of yellow bamboo -- approximately 1/2-inch diameter or slightly larger -- and joined with hose clamps where four or five inches overlapped. I worried that spreaders just 10 feet long would be too short, but I ended up cutting a foot off them anyway, after the wires were strung.

The antenna goes together fairly quickly once the parts are on hand. I know I reinvented the wheel several times, and learned some tricks that I want to pass on to others. The construction details are a very long bit of text, but I know I would have appreciated a step-by-step tutorial when I started out.

Please see the Word .doc in the Files/VE7ASK folder for complete construction details.
http://groups.yahoo.com/group/hex-beam/files/VE7ASK/

The construction story is divided into these sections:

The Center Hub
The Center Pipe Bolts
Assembling the Hub
The Feedline
The Spreaders
Starting the Bendy Part of the Job
The Wire Elements
The Smarter Way
Feeding This Baby
Turning Things Around
Putting It On the Roof
Next Time

Your Mileage May Vary
==========
In describing my antenna project, I have tried to be very honest

about corners I've cut, and things I would and will do differently. Maybe one of these days I'll be able to report the final final results, but I wanted to post as much info as possible for anyone else thinking of building one of these.

Although I am pleased with what I've built so far, I think I got lucky with my element pruning. The results of YOUR hex-style beam will probably be even better. And my results will only get better as I work on it or build the next version.

My project shows that a hex-style beam can be built using very cheap materials -- bamboo sticks and plywood. It won't last for years without frequent care, but it's very sturdy. Twice, wind storms blew over my lousy test stand (two and a half concrete blocks and a bit of 6" PVC). Both times, the antenna fell from 14 feet. The spreaders hit the ground and a fence without a scratch. The thing weighs 20 pounds or less, and seems to love the wind.

If you don't have seven months and two young sons to help build one, then definitely buy one. Either way, I don't think you will regret it.

Thank you for reading, and please let us all know how your own project is going!

73,

Bud Mortenson, VE7ASK

From: David P Douglass
Topic: 1061 Message: 1061

Hi Bud,

Very well done, enjoyed the article and pictures and looks great. It's really good to see someone else using a little more wood in their antennas! I've always felt it gets a really bad press which is totally unwarranted. I've had a total of 4 wooden beams up over the last 4 years and never had a problem yet (with the wooden parts anyway!)

Your log insert is interesting and I would say that at least some of your success is due to the preference of the 'Best Mode'. I would have to say that without a doubt, using CW has been the single biggest factor in bumping up my DXCC tally.

Anyway, good to have you amongst us Bud and look forward to working you in the biggy (CQ WW) at the end of November.

Regards

David, VK2DPD

Hi Bud,
congratulations for your home made Hex!
I would like to share some note for the home brewers, who want to use insulated wire. I've had built a 28MHz monoband Hex and a 80/40/30m vertical during the summer. I used #14 gauge insulated speaker cable and I found out that the Velocity Factor is 0,954. For both antennas I had:
design Freq real resonance
28.300 27.000
10.110 9.700
3.650 3.500
My Vertical is working pretty well on 10m band too, so I did some A-B comparisons.
On RX front direction Hex have 2-3S over the vertical.
On side direction they are equal and on back direction vertical is 0-1S better.
On TX front direction Hex is 2-5 S better, on side and back both antennas are equal.
The vertical is 10m long, installed at the garden, the Hex was put on top of the roof of 2 flat house.
Now the Hex is removed, a 6m mast is installed, so when weather permit I will pickup a 5 Band Hex.

1064. Wind survival

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-16 20:10:19 UTC
From: Eric Carling
Topic: 1064 Message: 1064

The first storm my Hexbeam had to weather turned out to be a force 9 gale with winds between 60 to 90 mph.
I lost 2 out 3 vhf/uhf antennas but the Hexbeam, though obviously being severely buffeted, was undamaged.

This aspect of the design is already known from the 3Y0C experience but thought I'd mention it for anyone who
didn't read that report and is considering a Hex now.

We are having strong winds (not gale force) now on the New Hampshire coast.
My hexbeam isn't even moving.

--- In hex-beam@y..., "Bud Mortenson" <ve7ask@r...> wrote:
hi Bud, good job. I also made mine out of bamboo (1,5 inch at the thikest point) and it works fine. On one band i also have a slight assymetric form of the wires , but not so much. As the bamboo is a bit thicker then yours , looking at the wires horizontally , they are slightly in a V shape (radiators and reflectors in the same way)
The bamboe should bent a bit more then it does now.
There is one suggestion i have for the homebrewers : at the end of the wires , i did not cut them but bended them around a bolt;it is a bit possible to see in my fotosection. I don't know how the material is called , but we use it over here to fix metal wires on eachother .)This way you can always make them longer if you want to.
Secondly , my swr is very low (see olso in my file map) and i think the reason is the use of metal thick plates on the hub for the connection of the wires onto the hub. I could be wrong ofcourse, if anyone thinks differently, please let me know ;-)
at last i have my soulmate !!!painting the house or making antennas!!!Well , i did both... (one with more pleasure then the other...:-( )
btw, thanks David and Holger for your help, as you can see you inspire people (instead of letting them perform there domestic obligations... ;-)

1067. STUFF

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-16 21:09:44 UTC
From: Andrea & Chuck Bridges
Topic: 1067 Message: 1067

1. I just put up my Hex-Beam HX-5Bi in time for the CQ WW RTTY Contest. I installed it on a HDX-30 mast on top of a ground mounted Yaesu G-800DXA rotator, so it's up about 26 feet. Construction of the antenna was straightforward. Since this is my first complex antenna installation, I fretted over the guying of the mast. I used 3/16" dacron and stainless steel quick links and turnbuckles. Everything is great, so far!

RTTY is not a mode that I have much experience with, but I decided to give the antenna a try during the contest. Prior to the contest, using a ground mounted GAP Challenger (a great antenna in its own right) and 100 watts SSB and 35 watts BPSK, I had worked 100 countries over a period of about 18 months. During the contest period I worked an additional 15 countries, just playing on the sidelines.

2. Thanks, Bud, VE7ASK for your descriptions. I have only home-brewed one antenna -- a three element wire Yagi for ten meters -- based on an article in QST. I think I may try some more home brewing, now!

73!

Chuck Bridges, AK6DV

1068. First Hexbeam to Hexbeam QSO

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-21 02:08:56 UTC
From: Jason Hissong
Topic: 1068 Message: 1068

Hi guys,

Thanks to Doug, W6HB, I had my first Hexbeam to Hexbeam QSO. There was definately a difference between the dipole and the Hexbeam. I would say an S unit or two. Oh yea, the Hexbeam is at 8' and the dipole at 30'. Both the dipole and the Hexbeam were pointed the same direction. The Hexbeam was also beaming through a tree and power lines. Not bad at all!! Cannot wait to hear what this thing does when I finally get it to 30'.

Thanks again guys... looking forward to many more Hexbeam contacts!!

1071. Bamboo hex in first contest

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-21 06:05:56 UTC
From: ve7ask
Topic: 1071 Message: 1071

Hello all. Thanks to those who wrote with comments and encouragement after my first post. I'm making notes, and it's all going to help with the next edition of my bamboo hex.

Thought I would update you on how the hex is working on its 20-foot push-up mast. I operated in the JARTS RTTY contest this weekend and managed 321 QSOs. My highest QSO total from home for any contest (DX, one- or two-day, CW, RTTY, or other) until now was around 230.

From southern British Columbia, this weekend I worked 29 countries with 80W-100W RTTY including the following (the 3.5 and 7 mhz contacts were on a G5RV):

Number of contacts per band

Entity	3.5	7	14	21	28	all
CN	-	-	-	2	-	2
DL	-	-	-	1	-	1
EA9	-	-	-	1	-	1
EU	-	-	-	1	-	1
FJ	-	-	1	-	-	1
FO	-	-	1	-	-	1
GW	-	-	-	1	-	1
HL	-	-	-	-	1	1
HP	-	-	1	-	-	1
KH2	-	-	1	1	1	3
KH6	1	2	3	3	2	11
KH8	-	-	-	1	-	1
KL7	-	-	1	-	-	1
OH	-	-	2	-	-	2
OK	-	-	1	-	-	1
SM	-	-	1	2	-	3
SP	-	-	3	-	-	3
UA/AS	-	-	2	1	-	3
UA/EU	-	-	4	1	-	5
UN	-	-	1	-	-	1
UR	-	-	1	2	-	3
VR2	-	-	1	-	1	2
XE	-	-	-	-	2	2
YL	-	-	-	1	-	1
ZL	-	-	1	1	1	3

Note: until I put up the hex, I had never even HEARD Morocco (CN8) or Melilla (EA9), but worked them both within hours of one another. Propagation into Europe was rather marginal during the contest, but I still did better than I would have with the G5RV.

I worked 90 JA stations, and 155 stateside stations -- including all call areas on 20M, all but W3 on 15M, and all but W2 on 10M.

All in all, I consider my homebrew hex a great success so far. Will try it out for domestic work in the November Sweepstakes CW contest, and again for its DX capabilities in the CQWW CW test at the end of November.

Thanks again,

73,

Bud, VE7ASK

1072. use for homebrewers

Hi guys , uploaded some foto's (with a better camera this time) of the construction in full hight and low hight . One of the foto's is a détail of the attachementdevice to connect the wires to the spacingrobe so cutting isn't necessary to adjust and the wire can be made longer if it was shortend to much before. (does anybody understand this??!!)
You also can see the motor i use for putting the antenna up and down (takes 1 minit) In its down position it can servive any storm.
For putting the wires to the spreaders i started from the inside (10 meters) putting a bit if tension on the bamboo , and worked like so to the outside. This way i graduatelly put more and more tension on the spreaders. But as you can see they should bent some more ; they don't but it is very sturdy like that. I'm happy with it results , worked japan, us , canada drom europe and had at least 5/7 reports using 100 watts . not bad for some bamboo and some cupper wires...
Hope it helps someone..
73's
Peter

1073. Bamboo Hex to HB5-i QSO

Bud,

Thanks for 1st ever Hex to Hex RTTY QSO at
JARTS contest. Your signal was very solid
(and so was mine?). I enjoyed the contest
and made 331 QSOs with this beam.

You have one HXCC point with me. Cong!!

You know, I just read the HXCC rules and now fully understand what
you meant. I thought you were referring to the ham in WA that talked
with us. Now I see that because I worked you on two different bands,
that means two points. Cool...

Anyways... my tower cannot get put up fast enought.... grrr...

For anyone that is interested, I have uploaded some pictures of my Hexbeam during assembly and installation on 8' mast. The mast is only temporary until I get the roof tower up. I used to have a vertical mounted there a couple of years ago. I may pick up a vertical to get on 80 and 160 (Butternut). We will see.

Pictures uploaded in the N8XE folder in the photo album.

Hi Jason:

You might want to consider keeping your hexbeam at 8 feet until your
get DXCC, sounds like it's working great at 8 feet. Just kidding!!!

1083. Re: New poll for hex-beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-23 23:05:39 UTC
From: n6tz
Topic: 406 Message: 1083

Just my opinion on a poll that asks what people think the gain of an antenna is:

It might be one thing to ask "are you happy with the antenna", if you are happy, who is to argue; but to ask what one thinks the gain is from using it is so un-scientific as to make a farce of our licensing structure.

Let's think for a while, the upper H.F. bands are going thru wildly varying conditions in this sun cycle. When you can have 30 or 40 db differences in the same path from day to day, then what is there to compare to? Don't tell me about comparing with the guy down the street that has a Whiz-Bang 40G, because he does not know if his is working correctly or how much his manufacturer lies about it's gain.

Then there is the guy that had nothing but a supper crummy antenna before and then puts up ANY type of beam on a 40 foot tower; he is going to think he "has arrived"!

The truth is that this is a compromised two element antenna that is darn good for the weight and size.....It is NOT a new scientific breakthrough or a super "new age" beyond science developement. Let's all get REAL !!! Remember, we are supposed to know something before we get a license? Or maybe the term AMATEUR is more fitting than I think.

From: ve7ask
Topic: 1084 Message: 1084

Having just arrived with my beam on a short 20' mast, I am happy to report that after work tonight I completed my five-band hex "sweep" working ZL7C on 20/17/15/12/10. The G5RV had a hard time hearing Chatham Island for a couple of the contacts. Using the hex, I managed to work the lads in wide pileups, as follows:

```
18-Oct-2002 00:12 28024.0 CW ZL7C Chatham 4th call 100w
22-Oct-2002 02:59 21015.3 CW ZL7C Chatham 1st call 100w
23-Oct-2002 02:05 18073.9 CW ZL7C Chatham 3rd call 100W
23-Oct-2002 02:09 14026.5 CW ZL7C Chatham 2nd call 100W
24-Oct-2002 00:14 24894.0 CW ZL7C Chatham 2nd call 100w
```

No supernatural antenna here. Just something better than the crummy one I was using. Still have to use the G5RV to work 'em on 30M and 40M -- and a rather long shot on 80M.

73,

Bud, VE7ASK

An opinion - yes. Valid? Apart from my complete lack of understanding how a Hexbeam users' poll has any bearing on the USA's licensing structure, I saw some validity until the last paragraph took constructive argument into the depths of insult thus negating the point of view completely.

Getting 'real' presumably is have an understanding of real world, practical situations not textbook theory. Being an 'amateur' is to know of, not necessarily to have intimate understanding for complexities of, such things as antenna types, efficiency, gain, etc. Scentific it was never meant to be.

The poll doesn't ask for a stipulation of gain, merely to give an opinion. Those opinions can be formed because we all take in bits of information over time. So we can actually take a reasonble and valid stab at recording in the poll how we think our Hexbeam performs compared to any other antenna we have now or another we just took down or with our buddy across town. Propagation now, yesterday, last week, in fact all the variables are subconsciously taken into account in forming that opinion.

Its about enjoyment, sharing opinions gained through experience and not about decrying someones lack of pre-license knowledge or conforming to interpretations of the term amateur.

I found the poll results in-line with my own submission and interesting in that they underscored the general consensus that gain is perceived to be high and more than might be expected. Therefore a useful exercise.

Eric G0CGL.

1086. tuning hex

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-27 15:22:16 UTC
From: b3s7a00@aol.com
Topic: 1086 Message: 1086

Hi.
I am homebrewing a two-band hex beam, and have come to the step of tuning the reflectors. I have an mfj antenna swr analyzer to use, and am confused on how to couple it to the reflector.
other questions:
does tuning the parasitic element effect the tuning of the driven element?
Is the reflector one long wire? Or is it broken in the middle like the driven element?
what is the tuned FREQ difference for the elements? 5%?
]
any help on coupling or anything else is greatly appreciated.

1087. new HEXBEAM owner

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-28 02:06:33 UTC
From: Phil Witherspoon
Topic: 1087 Message: 1087

Hi group, my name is Phil Witherspoon (NH2PW) and I'm the proud parent of a new HB. Below is an e-mail I sent to Barry (W4WB) this morning. I've only been an active ham for a couple of months since transferring to Guam. Not many active hams on Guam anymore so I've adopted Barry as my elmer and he has been most gracious with his time, responding to all my newbie questions with thoughtful advice and suggestions. In fact at his suggestion I purchased the HB and assembled this weekend. Some background - my primary rig is a FT-817 which I had sent to Barry to install a dual mode filter. The rig I used this weekend in the contest was my backup, MFJ-9420 SSB QRP transceiver. I had been using a portable dipole (BUDDIPOLE) for an antenna. Not really made for DX, especially operating QRP. I'm very pleased with the performance of the HB, ease of assembly and quality of materials. If you need a Guam QSO, just send me an e-mail at NH2PW@... and I will try and accommodate.

"Barry, got good news and bad news (sort of). Good news first. It's Monday morning and the wife called and said I have a package from you. My FT-817 has arrived! Still in good news vein, Saturday afternoon broke out the HEXBEAM and put together. Piece of cake. Took me about 3 hours to assemble and mount on mast. Only challenging part was it was pouring down rain - didn't let it stop me tho. It really is beautiful and instructions were right on. Only thing I didn't do was drill the hole in the base plate, afraid I would get shocked. Now the bad news. I'm afraid you won't be my first contact - in fact you won't be my first 100. Contest was on, I was pumped and well, just couldn't help myself. What a difference this antenna makes. I worked all continents except Antarctica. Ended up early this morning with a total of 101 contacts with 2 dupes. Manually kept the contest log, just didn't catch it. Tired but happy. Just hope I don't fall asleep at work. Hands are sore from manually rotating the mast, rotor still not here. Sorry about not waiting - once I get the 817 hooked up you can be my first on a band of your choice other than 20. Did you work the contest, I listened for your call letters? Thanks again for making this possible. 73, HHBO (happy hexbeam owner) Phil (NH2PW)"

Phil:

Congratulations and best wishes! As an "old" user of a HB (at least 6 months) I wish you welcome to the group,

All the HB folks are nice and love to offer suggestions, support, and words of wisdom. Even Barry can be useful (on a good day!).

73,

Herb K6HJM

1089. Hex-Beam number 255 on the air !!

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-31 03:32:20 UTC
From: aep002
Topic: 1089 Message: 1089

I ordered my Hex-Beam from Mike after using one for several hours at our ARRL New England Convention special event station W1A.

When it arrived I used a 3 ft tripod and short mast as a holding fixture to build the antenna. Got some help from my wife to hold the wires in the insulators while I tightened them but otherwise assembly is a one person show. I ran a coax out to the tripod and worked some European DX with the antenna 5 ft off the ground as soon as I had it built.

I put the Hx5Bi up 30 ft with a 10 ft 1-1/2" aluminum mast and a spare 23 ft extension ladder bolted to my shed in the back yard. This puts the 20 meter elements at about 33 feet as far as I can determine. Turns with Radio Shack TV rotor. Used some 3/16 rope for guying just to keep the ladder & mast from swaying. NO NEED TO SPEND $$$ ON A TOWER WITH THIS ANTENNA !

At 30 ft the antenna beat my G5RV by a couple of S units most of the time on any band 20 through 10, any direction, even though the G5RV is higher at 45 ft as an inveted vee -- and I've worked a lot of DX with the G5RV incl. Japan and VK/ZL area. The new beam is pretty close in performance to my 15 meter resonant dipole at 45 ft when working stations broadside to the dipole, but much (3-4 s units) better than the dipole for stations off the ends. The dipole is much higher than the beam so it's not really a fair comparison. All I know is with the beam at about 330 degrees I called CQ for 15 seconds with 500 watts and a JA came back to me on 15 meter SSB. Could barely hear the JA with the dipole. Works great with just 100 watts both DX and stateside.

Even though I have no antenna restrictions in my neigborhood, I used Krylon camo paint (black, brown, olive drab green) to make the fiberglass spreaders, mast and ladder blend in with my trees in the background. It's almost invisible from the street. Did not paint the wires 'cause Mike Traffie doesn't recommend it and besides they will turn brown like an old penny after a few months.

The beam fits where my TA33jr would whack into trees and gives me the WARC bands too !

Hope to have some pics to show some time soon. The extra money spent on the antenna was saved by not buying an expensive tower in my case.

73,

Art Pizer
NF1A

Congratulations Art on becoming operational. I picked up K8T this afternoon on 12 m on the 1st call even though there was a nice pile and he was just 56. Heard 9A9A on 10 m and gave Emil a call. He was a wonderfully strong 20/9. Both of us were surprised that I was 40/9 and the loudest he had heard today. It was great propagation between us of course, but the antenna didn't hurt. hi hi I look forward to more of your experiences with your several antennas. Have fun!
73,
Barry - W4WB

1091. Hex assembling - the right way?

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-10-31 08:21:05 UTC
From: lz2be
Topic: 1091 Message: 1091

Hi guys,

preparation of details for my home made 5band Hex are almost finnished. If weather permit I will try to assemble and put it up during the weekend.
Unfortunately I must assemble it working alone on the roof of my 2 flat house (about 9m above ground). The reason is because from two sides there are power lines, there are trees at the third side and my vertical from the fourth side.
My idea is to put the central hub/pipe with all wires connected to it on the rotator, after that to install the spreaders and at the last to connect/tight wires to spreaders.
The roof is not flat, so I will turn the antenna to reach spreaders one by one from the only possible place.
My question is what is the right way to do that job? From where I have to start - 20m to 10m or 10m to 20m? To connect 20m wires to free standing spreaders and then to fit the spreaders to the hub?
Thanks in advance for the suggestions.

73 de Bob, LZ2BE

Hello Bob,
sounds great...
Before installing any element you have to fix the support lines
between the spreaders, than you fix the two spreader with the
isolators to the centerhub and than start with the elements beginning
from 20m. I would recommend to do it the first time on the ground...
It takes some more time but you will know the technology how to
assemble.
regards Holger

Hello KC0LND,
have you ever modeled your beam on the computer?
How do you feed the elements?
What bands/element lengths are you using and what is the distance between the elements?
The difference between reflector and radiator length is about 2% in multiband versions. The reflector length is the most important part for the antenna gain. By changing the radiator a little (!!!) bit you can influence the feedpoint resistance.
Something deep inside tells me that you did not model your project. I highly recommend you to do that first and start with a single band version (model) playing around to get a feeling for the antenna.
Nevertheless let me know if you have any questions.
regards Holger
PS. I got only one feedback concerning the modelling. Nevertheless I will put some EZNEC30 files for single band versions into the file section.

Topic: 1086 Message: 1094

Hi again...
Thanks for the info.

Well,... I haven't yet tried modeling the ant, but I am following the instructions by EI7BA very closely. The only difference being (INSULATED WIRE). I know it will detune the elements, but it was all I had available, and I didn't feel like stripping the wire like I have done in past projects. I am cutting the wire for 14.05 MHz, even though I want it to function in the mid-lower CW band. (**Compensation for insulated wire**).
I am feeding the elements by coax, 50 ohm, with an insulator between the wires... The whole works is potted in silicone. (to keep off snow, and Ice)
Does the resonant frequency of the driven element effect the anything but SWR? (I have a crazy thought in my head: that the antenna's gain, FBR, etc., will function relative to the freq. designated by the reflector, and driven element length will effect SWR, with less effect to gain etc. As I said, this may only be some strange delusion on my part, but its in my head nonetheless. (does it have roots in the truth?) Or is the driven element important for gain, (and such), too? (I was going to multband 20 and 10 meters, but am now only doing 20, due to lack of descent weather)
TNX for info, 73 Tony (KC0LND)

Hi,
I have joined the HB group despite that I do not own a hex-beam...or any other beam. But I do have a Titanex ULT1300 mast with a 2x10m inverted vee + 450 ohm ladder line. While I consider a heavier load I absorb all information about light beam antennas. The ULT1300 mast is very light and flexible (Titanex claims the flexibility is an advantage). I have an excellent QTH in Copenhagen and get out very well also with the wire antenna. But next spring I want something else.

Hello Tony,
during the summer I built a 10m monoband Hex. The model was done by using of MMANA to be resonant
on 28.3MHz. I used INSULATED wire #14, directly fed with 50 Ohm coax. The best SWR according my
radio was measured at 27.0MHz. Even in this case the antenna was vy good! It looks that velocity
factor of such insulated wire is 0,954 so I had to shorten the elements 0,954 times. The same
sitiuation happen with my 40/30m vertical. 10MHz section was made by the same insulated wire and I
calculated same VF=0,954 while 7MHz Alu pipe section was OK.

Pro: Performance - at least 8.2dbi claimed forward gain. When their Moses Lake, Washington station does its tests into Europe, it is just amazing to hear.

Cons: Price (£1075.00 in UK not including control cable and transceiver interface) and size (16ft boom and 36ft element length).
The brushes will wear - how will that affect performance?

Hi George,

Main cons are it's much larger size, weight and wind loading (torque too). Gain is a bit more as claimed. I understand that they have life-cycled the tuning over a million times w/o failure. My question is how well it will withstand oepration near the sea and a heavy UV environment. The Hex-Beam is field proven now.

Only heard one on the air and the station was unremarkable (similar to other staions on the band) most likely due to proprogation at the time. I often get BIG signal reports too, but we are always a slave to the proprogation.

A good feature is its "optimum" tuning. The 5-band Hex-Beam performance is not quite as good as a mono-band Hex-Beam understandably, but it darn good. Instant band switching is just great.

If I had the space, tower, rotor, neighbors, etc. that would allow the SteppIR3, I would give it a go.

Either antenna will serve you well.

73,
Barry - W4WB

Thanks to all whom have commented so far. Question can you use a ATU to tune on other frequencies than those covered by the main bands? What about using the Hex for SWL?

I was faced with the same decision when at Dayton in 2001. In fact I'd filled out a purchase agreement with the SteppR people, including my credit card info. When I got home I looked at my property again and decided that the SteppR was just too big for my lot. The SteppR people were very gracious about my call to cancel my order. They are top notch and I would have enjoyed the 6 meter band that the Hex doesn't offer. So now I have two hex antennas. The travel version monobander (which includes 6 meters) and the 5 band on my roof. I'm very happy with the Hex-beams. Ed, N0OQ

Hi George,

Yes, you can use a tuner to play with the Hex-Beam outside the normal
bands.

Several of us have played games with the HB and a tuner to operate on
6, 30, 40, and 75 m! Strange experiment, but it worked. I have no
idea what gain is for any of these bands (or why it works at all
here), but there was directivity. I recall on 30 m that a fellow in
MO (about 400 miles) said the signal was strong and the F/B was maybe
15 dB. Go figure. W6HF has have some fun on 75 m with great
results. NO, the Hex-Beam isn't an optimized antenna for these other
bands, but it works to some extent and extends the useful operating
coverage for those having no low-bands antenna(s).

Look at some past postings for more data.

Hi George:

I own a 5-band hexbeam and have a friend in Florida who owns a SteppIR.

I really like my Hexbeam.

And he really likes his steppIR.

The SteppIR has several features that the hexbeam does not have:
1. It has 3 elements vs 2 for the hexbeam, thus more gain.
2. He can change directions 180 degrees in 3 to 5 seconds by making the reflector the director and vice versa.
3. It has a bi-directional mode where he can make it into two 2-element beams, 180 degrees from each other, by having two directors and no reflector. Thus, he can transmit using two beams at the same time, one facing one direction and the other facing 180 degrees away, allowing him to operate "Short Path" and "Long Path" at the same time.

BUT it is really BIG compared to the hexbeam. I think the elements are 36 feet long. And it is much more complicated with the motors and tapes plus an expensive control box for adjusting the element lengths and changing directions, bi-directional, etc.

So it gets down to a question of perhaps a little better gain for a lot more space required for the elements and for turning radius plus a bigger rotor and higher tower (Hexbeams work great at 35 to 40 feet).

Their both good antennas. How much is a few dbs of gain worth to you and your neighbors???

Good luck in your decision.

1109. New Hex Beam on air

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-11-04 08:49:26 UTC
From: lz2be
Topic: 1109 Message: 1109

Hello friends,

I'm glad to inform you that my home made 5 Band Hex Beam is on air since Saturday and it works great!
I will try to upload some pictures later.
All assembling jobs were done working alone on the roof and it took me 1.5 hours to do it.
The model was done on MMANA engine, twin line between elements, BOTTOM feed with single coax through coax balun. All elements are done with INSULATED wire, cut to 4.6% shorter than the model dimensions (VF of insulated wire). The distances between elements are not changed and they are same as in DL7IO presentation.
The SWR on 20m is close to 2, with increase at band beginning to 2.5, but this is normal because the antenna is only 2m above the roof. On other bands SWR is lower and within range 1.8-1.2 depend of frequency, prety close to the predicted.
How the Hex works? I'm fully satisfied - 10 new countries on 12m, 3XY7C on 2 bands since first call, "booming signal" from ET3PA, I passed through several pipleups with 1-2 attempts. Compared to my Vertical I had 2-4 S units gain.
Of course it is not like the 7-8 el monobanders at local club, but for me it is an excelent antenna!

Thanks to all who responded. The decision is near made in favour of the Hex given space and social constraints.

One final question not yet answered. Is anyone using the Hex to also Rx SW broadcasts or utility Tx? I may or may not be able to put up long wire or loop for SWL but would be interested in knowing what sort of performance that can be expected across the SW bands for Rx only with a 5 band unit.

Hi,
In my case I think a home-made 20m monobander is the right choice. I have fiberglass spreaders (4m long) from a commercial Quad antenna. I am a bit concerned if it is a good idea to use them. I do not like to shorten them. I am curious if anyone already has tried this. I am happy that I joined the HB group and get access to valuable info. I have now uploaded a picture of my empty mast.

Yep I agree that operation is possible with a tuner to Tx outside the stated bands but I am wondering about SWL Rx as you cant use a tuner to SWR the antenna without Tx unless you use a minimum noise method to "guess" or a SWL tuner which means switching cables. I suppose I could just connect the Rx to the cable and tune by ear but I was wondering if anyone had actually done this and how successful it was?

I got to see this antenna and the hexbeam at Dayton 2002 Hamvention.
It is pricy, but it appears to be of very heavy duty construction.
About 35 pounds. Hardware and clamps are all stainless. Very FB
construction.

It has an interesting feed system too, as well as nesting
conventional yagi's within a moxon.

Its size and turn radius is small, but it is much heavier than the
hexbeam. The hexbeam is light enough to put up on a TV mast, which
seems to me one of its advantages, plus it has 5 bands.

Both fill a useful niche.

But thats just my opinion.....

Hi Dieter,

Why do you say "Some facts - not rumors about Hexbeams?" Cebik's model doesn't agree in detail with the observed performance (he used a matching network). LB has never actually tested a Hex-Beam. His conclusions about bandwidth and SWR when the feedpoints are brought closer together (to obtain near 50 Ohm impedance) are not consistent with the observations I and others have made. Some so-called facts are little more helpful than "rumors" (whatever you mean by that).

I understand that a club up in New England recently compared the Hex-Beam against a new TA-32 in a number of A/B tests. Apparently the Hex-Beam outperformed the TA-32. Is that rumor or fact? Those guys figured it was fact to them.

Nice things about antennas is that there isn't a best one for all applications or operators. We can never run out of things to try and build. :-)

73,

>
> Why do you say "Some facts - not rumors about Hexbeams?"

Hi Barry,
I'm watching the mail traffic on Hexbeam for a while and was really
surprised about all of the enthusiatic mails written in the past ...

For example:
... Comparison Hexbeam 3-4 S-Units better as antennas xyz ...

The only thing I want to do is to bring the discussion "back to
reality" ...

Facts are:
==========
-1- The Hexbeam is a 2 element beam
so the maximum gain can be 4 db over dipole
and it doesen't matter what kind of design for two wires you are
using ...

-2- if you are using a Multiband System
you will never get the maximum on all bands

-3- if you ever simulated DL7IO's design of the 5 Band Version
you will see the gain on 12m and 10m is very close to a simple
dipole; 20m to 15m is performing better - but never better
than a 2el. beam -> means 4db over dipole

-4- you can't compare antennas on different heights ...

-5- you can't compare antennas within one or two qsos on
"short skip" ... that's nuisance ...
```

Cebik's
> model doesn't agree in detail with the observed performance (he
> used
> a matching network). LB has never actually tested a Hex-Beam. His

Am sure you will be pleased. Despite the stange statements a couple of folks have made about the 10 & 12 m Hex-Beam performance being no better than a dipole on these bands, I am sure you will be most pleased with its performance. For example, Ed P5/4L4FN has found the 10-15 m Hex-Beam has made a world of difference (not to mention that the ham world consistently now comments on his stronger signal) over the Butternut vertical he had been using.

BTW, what is your call sign so that we can listen out for you?

I guess I just don't understand why LB Cebik didn't model the actual hex-beam design people actually use. But, then, his comment about the "end-coupled set" gives me an indication -- perhaps he simply doesn't like Traffie and would rather not see him get any business.

I totally agree that the claims I see from Traffie are suspect, but that's no reason to model a different antenna, and then imply that it's attributes apply to the commercial design.

That sort of gamesmanship forces me to label cebik.com as "for entertainment purposes only". I simply can't trust LB's motives anymore. That and the fact that my "impossible" 17m L keeps making DX contacts.

1125. EZNEC3.0 model files

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-11-13 16:21:25 UTC
From: dl7io
Topic: 1125 Message: 1125

Hello,
because of my QRL I had to be off for a while. I downloaded a zip file in the file section under my call. This file includes single band models from 10-80m for EZNEC3. I guess this program is what people have mostly available, who are willing to come to the basics. An extra excel file is included to change element lengths or end insulator lengths for playing around with the model file and look for other optimums.
I would be happy to get a feedback...

Concerning the comments on Cebiks comparing of different 2 element designs I really have a problem to follow the arguments. But may be it is because of my poor English. It is correct that Cebik took not the actually used design. He did a small changing in the feeding system with the result that the model he finally used for comparing the different antennas is better concerning the gain/bandwith relation to that what we are using for radioing! So he gave an extra point to this design and did not work against Traffie. Please read again carefully the comments he gave. Everything he wrote is correct. We are designing the antennas for direct 50 Ohm feeding. This of course makes the antenna more simple. But we miss the point with the best gain. In the area where we have a SWR less or equal 1:2 with 50 Ohm the gain already slopes down from the highest point. And for bands with more than 100 kHz bandwith the gain difference between the ends of the band is about 2 dBi.

Please do your homework and find it out yourself before we insult somebody. I'm sure Cebik has enough other things to do and enough own success and no reason nor needs to think about how he can work against someone else.
Holger, DL7IO

The comment that stands out to me most is his reference to the
"end-coupled set". I am certain that this may be difficult to parse
if English is not your first language (and even if it is), but this is
a rather nasty insult.

I'm afraid that has colored by perception of LB permanently.

Not to diminish the comments about Cebik's analysis of the hexbeam, but perhaps some restraint can be exhibited for a while. His wife just became a SK after a year-long battle with cancer.

And, for what it is worth, I do not believe Cebik has any financial involvement with any particular antenna or design. MFJ published his most recent book, but that appears to be the extent of his commercial involvement with a manufacturer.

I will say that the Traffie Hex-beam web page is up front in discussing that the antenna appears to always outperform the modeled expected performance. I know very little about antennas, personally. I'm an accountant, not an engineer. But, I suspect there is something in the design that creates a "compressed" take-off angle, and a more narrow elevation beamwidth. Maybe 70% of the signal concentrated within the 10-15 deg. elevation pattern, rather than having 70% of the signal within say 10 to 45 deg elevation, for example. Thus, the height above ground becomes important. While modeled gain, pattern, f-b, etc. may never match that of a yagi, I think there are some characteristics that the modeling programs just aren't catching yet.

Having said that, I also think that asking the "opinion" of the user about the "perceived gain" is not a worthwhile exercise. Kind of like asking people to estimate the volume of a jet engine (and express the answer in dB!).

Best to all, and condolences to L.B. Cebik on the loss of his wife.

Well put Marty.

Some of my thoughts on the subject at hand. These are not directed towards any person individually so hopefully I won't get blasted either.

The final decision on which antenna design to buy or build ultimately belongs to the person doing the project. The informed amateur will gather available pertinent information, do his (or her) own analysis of designs, tradeoffs, and applicablility to the space available for the install, allowable budget and intended use. If one should disagree with the results of anothers antenna design analysis, then such is life (unless the 2nd party is of course paying for the analysis - then they have the right to express the concerns, etc. as they feel necessary). If you should disagree with another's study or analysis, then I would suggest that either 1) disregard that as input in your own analysis or 2) give it less weight as an input. Too slam someone whose analysis differs from yours is definitely not applicable to common courtesy. If you feel that your analysis is sound and solid, by all means, post or publish it for the amateur community to review and use. If you do disagree with someone else's analysis, state so but try to do it in a friendly manner.

I have been watching this forum (as well as other like antennas) to gather actual user experiences, likes, and dislikes of commercially available small beams. A common trait in all forums seems to be "all it takes is one wrong word by someone to light the powder keg". I read Mr. Cebik's review as part of my analysis of acquiring a Hex-Beam for my QTH. He states that the designs he was reviewing were not in any way related to any commercial antennas, but rather ones he has dealt with in the past.

I have talked to the folks at Traffie Antennas to get answers to my questions concerning the multiband Hexbeam. I feel that I will most likely get one real soon, but until I actually have one and test it out, it's is a gamble on my part. A gamble that I feel is worth taking, I might add.

Anyway my two cents worth and I hope to soon join the ranks of happy (and no one's fault if I'm not) Hex-Beam owners.

Sidenote : I wasn't aware of Mr. Cebik's loss. I would like add my condolences to him on the loss of his wife.

73 es gud DX,

Gene KI6LO

>>feel that I will most likely get one real soon, but until I actually have one and test it out, it's is a gamble on my part. A gamble that I feel is worth taking, I might add.<<

Remember you can return it within 30 days if it does not work out (you are only out the shipping) I made the decision to get it because of that. I have yet to see that kind of return policy on another antenna (let me know if you find one). Am I expecting a three element beam performance out of it? Not really. I am expecting two element beam performance. My comparison was with the F12 XR5. This was lighter so the Hexbeam won out. Now, when I finally get this thing on the tower I can really start to see if it beats out a 3 element beam in some cases. If it does, great! If not, it still meets the expectations I set for myself.

As far as LB Cebik is concerned, I read his articles with great interest. I have learned alot. However, I also understand that it seems we rely way to much on models. It is the best we have, but models are exactly that, models. It is very hard to duplicate an antenna in real life. Too many variables. Models should be looked at as a starting point and that is all. I have been comparing models between my inverted V and my vertical (with radials) and according to the model, I should get about the same performance at a low elevation angle. However, the vertical is beating the dipole by 2 S units on DX stations!! But the model says that it should be the same!!

While folks argue about models and how great/horrible antenna A compared to antenna B is, I am making DX contacts....

Just my .02....

--- In hex-beam@y..., "dl7io" <dl7io@q...> wrote:
> Hello,

Hello,

I don't have enough experience with EZNEC, because I have EZNEC Demo version, which limits the number of segments. I'm using MMANA created by Makoto Mori and maintained by Gari,DL2KQ.
I just uploaded in Files section the MMANA model of my installation. In my case the antenna is bottom fed (10m band section) instead of "normal" top feeding (20m band section). I did it because of practical reasons and because MMANA doesn't show any significant difference of Hex performance in both cases. Some day I will try also top feeding, but now the WX is not good to get up on the roof..hi..
Working with MMANA I understood that the most important thing to have a model close to the reality is to use as much as possible number of segments. This should be applied especialy for antennas with lot of slopes like Hex beam. In my case I'm using 500-800 segments for whole antenna, depend of freq. With decreasing the number of segments you can see completely different data for R, X, SWR and paterns.
I agree with LB Cebic's conclusions, even he used slightly different model (N7CL). The N7CL model have little bit better performance than usual Hex, but from practical point of view it is more difficult for installation.

Thought it might be of interest to share a recent odd-ball operating experience. I was doing some testing of some new software in a tuner with a FT-897 rig. Figured using the 5-band Hex-Beam on 40 and 80 m to "stress" the tuner would be a good test.

Happily, the tuner found a 1:1 match at 3.5 MHz (and over the entire 75 & 80 m bands if you retuned). Similar on 40 m. I made some daytime 40 m Q's from my QTH in Alabama to IL, KY, and WI. All were amazed that my signal (100 W) was about the same as the others in the group. Seemed to be maybe an S-unit or so of F/B too.

Early the other night I decided to give 80-m CW a try for a few minutes. To my surprise, I made several contacts and got nice signal reports. The F/B was noticeable though less than on 40 m. Fact it worked at all is interesting. W6HB has made some comparisons with his HB and Hortical antennas on 75 m as I recall with good results.

I need to give it a try later at night and see what DX I can work. Regretably, I have no other antennas at the site where the Hex-Beam is located for a direct comparison.

David down in VK-land has also played with his 5-band hex-beam on bands outside the 10-20 m range. Works for him too.

Barry:

Now you are saying that I don't have to restring my 160 M Loop under my new Hex-Beam? I just got my new HX5B up last week and have been having so much fun with the DX on the upper bands that I did not experiment with trying to load it below 20 Meters. I believe my serial # is 241.

I have been very relieved at the propagation at the 70' level on my tower. If I am handicapped by being this high, I can suffer for a while with the "limited" performance. South Korea and Japan with the 817 had me really grinning! The Grey-line propagation has been awesome. Now I know that the propagation has been good but it has never been that good for me QRP. I find it curious that most stations give me a better signal report by a couple of units than I give them....

Does anyone on the list have some experience with the 40M Hex? Has anyone tried loading a 40M hex on 80M?

Can I just check one thing? Is there any danger of damaging the Hexbeam by loading it on 40 / 80? Would there be a power limit?

Having read your post, I just tried tuning mine on 80m and it receives better than the GAP Titan! But I haven't tried to work anyone yet as I'm not sure what that might do to the beam.

Eric.

Just got off the phone with Mike Traffie and he suggested not putting any large amounts of power to the antenna. He didn't think it would be hurt at the barefoot level but said that they have had some insulators returned that exhibited some RF burning. He decided not to ask any questions of the owner as to his operations. He said that they have not experimented with transmitting out of band with the HX5B themselves, but he says that the 40M hex was 2 to 3 S units better than the HX5B receiving on 40M. He had some pretty good stories about the performance of the 40M Hex leading to insomnia!

Might be my next investment for the Spring. Still would like to hear from some 40M Hex users.

Hi Paul & Eric,

Well Paul, I would still put up that 160 m antenna! Also, I would not operate the HX-5B at more than 100-200 W since the impedance is really "strange" on 40 and 80 m. Use a 259B and you will see what I mean. IOW, I agree with Mike.

If you can do some A/B comparisions with the GAP and HX-5B on 80 & 40 m, that would be interesting. BTW, George at GAP died yesterday. :-((

Mike ran the tests of the HX-5B and his 40 m HB at my suggestion some months ago. His tests of the 40 m HB against a dipole at the same height (in the past) and the recent comparision of the HB-5B and the 40 m HB indicate that the HX-5B is about the same or a bit poorer than a dipole. Mike's test didn't have the two Hex-beam at the same height simply due to it being a quick test of what was up at the time, so YMMV. Heck, if the HB-5B is even close to a dipole on 40 and 80 m, I will be happy enough. Extra bands for "free."

I also note that I have used it on 6 m too with good results. Lucky for me that the band was opened when I was making the test!

1139. Playing on 30 m with the HX-5B

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-11-21 00:35:19 UTC
From: w4wb
Topic: 1139 Message: 1139

I had a few minutes this afternoon to experiment again with the HX-5B on 30 m. Many months ago, I gave it a go and found that it worked, but haven't really used it at all since then on 30 m.

It is a bit touchy to tune using the internal tuner of the FT-1000MP, but it did tune and the SWR meter on the MP indicated about 1.2:1.

At first I listened mostly and observed about 1.5 to 2 S-units of F/B. There was a bit of QSB, so who knows. In any case, it wasn't like a vertical.

I made several contacts and each gave me a 599, and commented that my signal was really good even after they learned that I was "misusing" my old Hex-Beam. When I have time to use it at night (HB is at my office), I think that will be a good test.

David (VK-lander) has reported working a fair amount of DX on 30 m using his 5-band homebrew hex-beam. In fact, David was the one that got the "misuse" of the HB started. Thanks David! :-)

When you are tuning up, I suggest that you back off on the power until you get the match about right and then kick the power up.

Barry,

I simply used the rig's internal antenna tuner on 30 meters. Made the contact on the first call.

I don't know which was a bigger kick: working a new entity, or making a contact on a band I had never been on before, using a mode I rarely use.

I haven't spun the antenna around on 30 meters yet, but I'll check it out and report back on whatever I find regarding F/B.

I've since worked them on 15, 17 and 20, but that 30 meter contact was very satisfying in its own way!

Take care.

1145. Out of band Hex

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-11-21 20:47:04 UTC
From: David Douglass
Topic: 1145 Message: 1145

Hi Barry,

Just to add to your experiences, I found that that the 5 band Hex had great performance on 30M, and I worked a fair amount of DX on all continents. Strangely enough when I switched the feed system to single band switching the performance deteriorated greatly, which suggests that the more wire you have up their the better.

Managed to work a little DX on 40M, but performance was way down on a 1/4wave vertical, and 80M was next to useless from here. I suppose for you guys in the US, it may be worth trying 80M as you will have lots more people in a workable area!!.

Also I think your comments on keeping the power down are very wise, although I had no issues with the exception of blowing a capacitor in the internal ATU when trying to tune on 80M (a failing with Kenwood TS570's).

Regards and hope to CU all in the contest at the weekend.

David, VK2DPD

Hi David,

I think I agree with you about the more wire the better. Over the weekend, I plan to give 40 and 80 m a try. I have worked Europe on 40 m, but not sure just how well that compares. Eric has the Titan and the HX-5B so maybe he will do a 40 m comparison. Tnx agn for sharing your original experiments with us. Oh yes, in playing more today on 30 m, I was really pleased at the evident directivity of the antenna. Signal reports were FB.

Take care and hope to hear in the the contest too. I just give points since I never have the time to make a good run of it (expect for Field Day where our club came in 9th overall). :-)

I am glad that I seen this...I have a TS570D(G) myself and would hate to do that to it... I will keep 80M to my dipole and vertical. BTW... just got back from the variance hearing and got approved to put the roof tower up (17.5'). This would put the Hexbeam at 32 feet with the 20M element at about 34-35'. Whoohoo! Cannot wait to stretch her legs.

Hello, I've just gotten interested in the Hex Beam antenna and I'm all agog with wonder and ignorance.

I've seen pictures of the HEX-BEAM (Model HX-5B) from Traffie Technology at K8AC's fine website and I noted that the coax plugs into the top of the 'mast'. Is there any reason it could not just as well feed all the wires from the bottom of the 'mast'?

Thank you.

1151. P5/4L4FN now QRT Permanently as of 22 Nov 2002

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-11-24 14:48:23 UTC
From: w4wb
Topic: 1151 Message: 1151

Ed P5/4L4FN was informed by the P5 Radio Regulations Board on Friday evening (22nd) that he was to cease all radio operations, take down all antennas, and remove all radio equipment. Saturday, he complied and that afternoon, officials came by and seal all of the boxes. He was instructed to take the boxes with him on the 10th of December when he again goes to Beijing for R&R.

The Hex-Beam and mast some of us provided him really help Ed to make more contacts and with those in areas that had been little worked before.

It is thought that Ed will be next stationed in another good DX country soon and he will have good gear to get started with there.

Best wishes ED!

I suggest that it will be after "reunification," and then I guess
that it will be a new entity and no more P5 or HL. The model would
be East & West Germany perhaps. No guess on the time line.

At the same time, the situation in the Spratly Is. may be getting
resolved as perhaps for Scarborough Reef.

It is interesting how politics keeps amateur radio lively by changing
things and, as a group, DXers know their geography probably better
than others! Since DXCC started there are about 60 deleted entities,
a number of added entities, and LOTS of name changes.

From: richlim11
Topic: 1154 Message: 1154

Hello all. I have been thinking about a hexbeam for sometime now, and after reading the numerous favourable posts here on the reflector, I think that I will make the investment this Xmas. I plan on purchasing a HXP for use at field day and to try at my home QTH, hopefully, if it meets approval with the XYL, it can replace my attic mounted antennas!! I was wondering if anyone has or uses Mike's masts which he sells on the website. For field day the portable mast would be great and for my home, I hope to be able to mount the sturdier mast on my upstairs bedroom Juliette balcony. Any comments from the group?
Thanks. Rich KQ9L

1156. Hex and contesting

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-11-26 13:09:36 UTC
From: lz2be
Topic: 1156 Message: 1156

Hello friends,

I could say that Hex beam is a very usefull contest antenna. I had 950 QSO at LZDX contest two weeks ago, when I used my home brew Hex for first time. My setup was FT890AT + 1Kw, 160/80/40m Vertical, 20/15/10m Hex beam.
The results on CQWW CW are:

```
--MULT---
BAND QSO'S DUPS POINTS DXCC ZONE SCORE
---- ----- ---- ------ ---- ---- ---------
160 42 0 52 28 7 1820
80 174 0 234 54 10 14976
40 520 0 816 81 24 85680
20 339 0 579 61 20 46899
15 464 0 846 93 28 102366
10 464 0 1116 95 32 141732
---- ------ ----- ------ ---- ---- ---------
TOT: 2003 0 3643 412 121 1941719
```

I had to turn the antenna only in case of big pileup. The Hex was pointing mostly to Asia at morning time and to USA/EU at afternoon. The main advantage of Hex is that you can hear a station from any direction and then to turn it to the right direction if necessary. If you have a big monobander you will loose such a DX or you will need second, omnidirectional antenna to check if somebody is calling you.

I have a question to homebrewers:
Did somebody checked what is the difference between top and bottom feeding of 5Band Hex? I'm with bottom feeding for practical reasons and becasue the modeling doesn't show any difference.

Best 73 de Bob, LZ2BE

1157. Fw: Hexbeam Masts

Date: 2002-11-27 17:02:53 UTC
From: Chuck Bridges
Topic: 1157 Message: 1157

I am using one of Mike's HDX-30 masts in a ground-mounted application with a
HX5-Bi. I have the mast sitting on top of a Yaesu G800-DXA rotator with is fastened to a length of steel pipe sunk into the ground and backfilled with concrete. I use two sets of guys (per the illustrations in the instructions) using 3/16" dacron rope. By the way, the mast comes to two top sections -- I chose the shorter section, so the mast is about 26 feet tall, plus the heigth of the rotator and mounting pipe.

The setup has been up about two months and so far I am very happy with it. We have pretty strong winds here (there are "wind farms" just down the road), so I check the tension on the guy ropes at least once a week. No problem.

This is my first antenna installation using a telescoping mast, so comparisons are tough, but the mast seems to be extremely well made. Erecting the mast is a three man job. My wife and I erected it by ourselves, and frankly, I risked the installation by doing so.

Good luck on your project and have fun!

Chuck Bridges, AK6DV

1158. 30 meter linear loaded hex

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-11-28 17:13:41 UTC
From: b3s7a00@aol.com
Topic: 1158 Message: 1158

Just a question, here,
Would it be possible to have a linear loaded 30
meter set of elements on a multi banded hex, with 20 met. as the lowest
non-loaded band?

I think the spacing would be incorrect, but I may be wrong.
I am not an antenna guru, but I have heard that driven / director
combinations require less spacing.
Any help appreciated, Tony, KC0LND

By the way, The other night, my home-brew hex had a f/b of about 12 dB. when
I first tried it out.

Be sure to use the new locking pins with a ring on each end, on that HDX-30 mast. The old pins with a ring on just one end may come out. 73's, Ed, N0OQ.

Congratulations Rich! For guy rope, I like the Synthetic Textiles 3/16" from AES. It is first-class for this purpose. Just guy the mast well! Also, use the ferrite bead balun.

I am QRV in Atlanta for a few days and wish I had a portable HB. Am using a Buddipole configured as a vertical dipole with the feed at about 25'. It works great, but the HB would be sooo much better! hi hi

Hi Guys,

After reading this message thread, I decided to try my HX5BI on 30 just for grins. The swr was just less than 3:1 with NO tuner, and the Yaesu FT890 AT auto tuner brought it down close to 1:1 in a few seconds. So far I only used it so receive 1 station, but at times that station was stronger than on my G5RV by 1/2 to 1 s unit. I am confident it will work as a transmitting antenna and will try it the next time I feel like working 30. My Hex beam is at 30 feet.

Hmmmm..... good point! Maybe extra-Hex-Beam is a better descriptor since we are using the antenna outside of its intended operating bands. Also not a bad term for those who are of a paronomastic nature either --- extra "hex-beams." ;-)

But seriously folks, has anyone modeled an HX5B on EZNEC or something similar to see what the gain and pattern figures are? I'd love to seem 'em.

Okay, HexTraBeam is good.

How about HexBeamPlus for those Ten Tec users?

Okay, I apologize to all for derailing a useful thread....

John,
Look in the files area. Holger took a stab at the 5-band version. Several models have been made of the monobander. Look at the copy of the Japanese Mag 59 in the files area. Also, LB Cebik looked at several antennas including a hex-beam like antenna in an article in AntennX. No one has tried to model the HX-5B operating on 30 m. It is clear that there are serious interaction between the element in this case (David VK2DPD showed this when he tried with a single feed and separate feed to each band --- only the single feed worked well on 30 m).

1172. Some model comparisons

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-04 18:57:30 UTC
From: Jason Hissong
Topic: 1172 Message: 1172

Hi guys,

I have been using MMANA (what a great free program) to do some comparison results between the 5 band hex model that was uploaded to the files section (thanks!!) and other beam models. I also compared the hexbeam to a dipole as well. I will write this up in a report to upload to the file section. Here are some of my initial findings with the following notes up front:

1. I am not an antenna expert.
2. MMANA uses MININEC
3. Frequency used was 14.050Mhz with all models.
4. All Antenna heights are 10M (the low end of the recommended height for the hex beam which can represent a compromised situation)
5. Antenna models used are a full size 2 element 20M beam, full size 3 element 20M beam, full size 20M dipole, and 5B hexbeam model by LZ2BE
6. Ground setup is Dielec: 13.0, conductivity: 5mS/m

This may not be the most accurate and scientific comparison, but one ham's attempt to get a good idea of the different antennas (and justify me spending the money.. hehehehe) I also wanted to do the comparison in a compromised installation with short towers, roof towers, etc.

Here is what I have found:

Antenna Gain (at maximum radiation angle):
Antenna - Gain - difference from previous listed model

3EL beam - 11.61dBi
2EL beam - 10.60dBi (- 1.01dB)
Hexbeam - 9.96dBi (- 0.64dB)
Dipole - 6.89dBi (- 3.07dB)

From these figures, the Hexbeam is about 1.65db less than a 3element beam. The Hexbeam is .64 db less than a 2 element beam however, it makes up for it in F/B.

F/B

3EL beam - 23.44dB
Hexbeam - 9.84dB (-13.6dB)
2EL beam - 6.60dB (-3.24dB)

From these results we can see that the Hexbeam does better in front to back compared to a 2EL beam. A 3EL beam seems to be a ton better

for this which would make sense. The elevation angle for these antennas:

Elev:
Hexbeam - 25.4dg
3EL beam - 26.8dg (-1.4dg)
2EL beam - 27.4dg (-0.6dg)
Dipole - 29.8dg (-2.4dg)

Here you can see that the hexbeam has the lowest angle of radiation compared to the other antennas. For long haul DX, a low radiation angle is better, so I attempted to get an idea of the gain at 10dg for each antenna. This way, you are comparing the antennas at the same angle:

10dg Gain and F/B figures (sorted by gain):
3EL beam - 7.01dBi, 20.05dB
2EL beam - 5.86dBi, 1.86dB (-1.15dB, -18.19dB)
Hexbeam - 5.71dBi, 5.59dB (-0.15dB, +3.73dB)
Dipole - 1.58dBi, n/a (-4.13dB, n/a)

The gain between the 2EL and Hexbeam are essentially the same, however, F/B ratio is still better. The three element beam pulls way out in front at regards of F/B and is only 1.3dB better in gain compared to the Hexbeam. The Hexbeam is still 4.13dB better in gain than the dipole. The hexbeam beats the 2EL beam hands down in F/B.

Initial conclusions:

For the ham who has a TV or a roof tower at 35-40ft, these results can give you an idea of what you can expect. Again, these are models and your results may vary. Real world performance cannot be modelled accurately but this can give you a starting point. From the results above, a 3EL beam is clearly the winner in all aspects (except for maximum radiation angle, but what really matters is what can it do at lower angles). So the real comparison is between the 2EL beam and the hexbeam. The hexbeam definately does better in F/B and only is marginally worse than the 2EL beam in gain.

If you are upgrading from a dipole, the hexbeam and 2EL beam is a good step in the right direction. The Hexbeam delivers 4.13dB of gain at 10dg over a dipole at similar heights.

When considering a beam, you may want to remember what the Hexbeam can give you. It is better in gain and F/B on 12,17M compared to small beams like the F12 C3SS. I have no practical experience with the F12 beam, however, a ham friend down the street from me does have one on a 40' tower. When my beam is up, we will do comparisons. An alternative to the HX5B is the 6 band beam from T.G.M. communications (MQ36SR). It provides gain on all bands as well and is cheaper. It is 26lbs and the turning radius is 8'3". Wind load is 3.1 sq ft. The gain figures on their site does not tell you what height their

beam is when comparing it to a full size dipole at 25'. From my estimations (from modelling) the antenna would have to be around 20M height for those figures. The T.G.M. antenna may be comparable with the 3EL model I used, but I am sure it would be worse because the T.G.M antenna is shortened. It uses hats at the end of the elements to get it to resonate. (Of course, this would warrant further investigation).

I think the Hexbeam is still the way to go for me for ease of installation. I used to have an MQ1 that I was going to use and it looked like it did not hold up well at all to the weather. Especially the tuning spokes. They broke off very easily.

Anyways, let me know if I missed anything or if I am way off base. Use this information at your own risk! :-)

73,
N8XE

<snip>>

One thing to remember: While the SWR of the 5 band model is reasonably flat across the bands, the F/B ratio and forward gain are not. For example, high in the phone band on 20 meters, there is very little front to back difference on my HX-5B. So, if one is buying the HexBeam primarily for SSB operation, you can expect to see much less f/b ratio than shown in your model. That's still not bad in comparison to other 5 band beams that might have too high an SWR at the other end of the band to even operate.

Also of note is the fact that most hams experience with a "3 element 20M beam" is with a trapped tribander -- and trapped tribanders are hard pressed to perform as well as a 2 element monobander in terms of gain, particularly after a year in the elements.

An interesting comparison but I would like to see how the hex compares at the upper end (phone) part of the band where gain and f/b decrease. My hx5i has only fair f/b (10 to 12db) on the phone portion of 20 meters. JOHN W3UX

Good point. I primarily operate at the bottom of the bands anyway (CW and digital) so for my needs it fits the bill. For SSB, your right. The F/B is not as good. For the prospecting buyer, if you want SSB, you can have them build it to the part of the band you want.

Thanks guys

1178. Holger's Tip Spacings

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-05 02:57:09 UTC
From: w5kde
Topic: 1178 Message: 1178

Has anybody built a hexbeam to Holger's design shown in his powerpoint document?
I am in the middle of building one and have noticed that his tip spacings are different than those calculated using Mike Traffie's formula. Not so much the 'exact' dimensions but rather the driven to reflector ratios. For example; Holger's tip spacings for the driven element are shorter than the tip spacings for the reflector. The formula comes up with longer tip spacings for the driven element and shorter for the reflector. I'm guessing that what's really important is the effective distance between the two element ends?
It just seems that if you swap the spacing dimensions, the bends and tensions on the spreaders will be less balanced.
If Holger's dimensions are proven in practice to be correct, what is the 'B' dimension..... is it the combined lengths of the tip spacings, or is it the effective distance between the element ends?

Hello my friend,

the distance "A" is a tip spacing for reflector and "B" is a sum of both driven + reflector. In
this case you will see that these spacings are almost the same calculated with Mike's formula.

I am tempted to claim that the actual distance from the spreader to the wire tip isn't critical, because of the non conductor nature of the spreaders. I would say that the uneven distances are to normalize distances between spreader tips, (because the reflector is longer than the driven element, and hence requires less distance to the spreaders to maintain symmetry). I would, however, say that the actual distance between the ends of the wires.... (Represented by the dotted line) is critical.

From: David Douglass
Topic: 1182 Message: 1182

Remember that Holgers design is for a 5 band beam and the Calculations on Mike Traffies paper for a mono-bander (at least this is the case on the paper I have read buy Mike). These dimensions are quite different.

I think if you stick to Holgers design you won't go wrong far wrong.

1183. mast fiasco

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-07 23:56:52 UTC
From: b3s7a00@aol.com
Topic: 1183 Message: 1183

Hello.
The hexbeam project just took a major turn for the worse.
Today, an attempt was made to elavate the antenna on to the top of its 35 foot mast.
The method was as follows:
-Mast (1.24'' TV style) supported by extension ladder extended to appx. 30'.
-Mast tied with ladder with quick release knots thet can be remotely untied by pulling on a string.
-supported with step ladder so antenna spreaders are not in contact with the ground.
-rope tied to top of extension ladder (not mast) and wrapped around a distant tree so the rope can be tightened, and then used to "rachet" up te mast so the people lifting can take a break.
-2 people "walk" ant. up.
-when vertical, 2 sets of 3 guys fastened to guy anchors (2 ft X 3 in. augers)
-ladder removed
(thus ends plan)
after the ant. was vertical, and the guys temporarily tied down, a tree branch obstructing the outside perimiter of the ant. was discovered.
since the branch was 30 feet up, it couldnt be readily removed.
(The branch was barely in contact with the wire, and only extended appx. 3 ft above it. (I have video tape of this stage, but no photographs)
The descision was made to cut the branch off at the highest reachable altitude (20 feet, using pole pruner, and step ladder.)
when the branch was severed, the branch tangeled itself in the wire. the heavy (10 foot) section of tree pulled on the mast. Because the guys were only temporarily tied down, they slipped. The tree pulled on the mast, and fell to an altitude of approximately 15 feet. The mast buckled in a "c" pattern.... 90 degrees divded over the entire length of the mast. A last ditch effort was made to save the ant, and mast by removing the 2 guys opposite the direction the antenna fell. The step ladder ws once again employed, and the hub of the hex was pushed so it was directly over the base.
the center set of guys experienced the greatest slippage. the center guy in the direction of the fall (opposite the direction of the bend) was to be pulled to restore the mast to a straight position. something gave, however, when the total bend angle was appx. 60 deg., and the mast came crashing down in a direction 90 deg. ccw from the origional fall direction. "luckily" the descent was slowed by tree branches, and the physical integrity of the beam remained realitivley unharmed. the ant was disentangeled, the guys removed, and the mast dissasembled. It is now once again in its position leaning against the railing on the deck. I will also require re- tuning.
Another attempt to raise the ant in a simmilar fashion will be attempted in the spring, but in the meantime, I intend to put the ant up 10 feet in my backyard for the remainder of the winter.

Ok..... well see how it goes from here.

Wow Tony. What a bummer of an experience! Only good news in your story is that no one was hurt (and that the Hex-Beam is okay).

In my experience, I have found that trees hate antennas. I have had them pretend to be out of the way and then up comes a big storm. Wind gets strong and the trees reach out their limbs to attack my antennas! So it sounds like some serious tree trimming is in order. ;-)

I don't know what mast you are using, but if it is the one from Radio Shack, you might consider overlapping the sections about 2', drill a through hole, and then bolt together. This will help stiffen it a lot.

GL in the spring!

73, Barry - W4WB

Wow, what a horror story. This is the kind of experience that lurks out there for all of us and shows that even well planned operations can go awry. I will echo Barry's thoughts, thankfully, no one was hurt.

If you were in my area, I would offer you a couple of cool malt beverages (no, not the antenna type!).

That was the conclusion that I had come to Bob, looks like Holgers
design might have a typo with regard to the tip spacing.

Tony's post (KC0LND): also makes the point that I was trying to
make.... at and that is, for the best symmetry, the reflector tip
spacing should probably be shorter.

Thanks for the feedback gentlemen

I had picked up on the formula variences David... Obviously the 5
band beam is a complex beast to design.
Back calculating from Holgers element lengths to determine the
formula constants, comes up with different constants for each band.
Not knowing what part or the band the elements were cut for also
doesn't help of course :-)
I fully intended to follow Holgers design to the letter David (with
the possible swapping of the tip lengths), until I read the posts
about the F/B ratio problem if the beam is not cut for your intended
operating frequency (CW or SSB).
Have you built Holgers design, and what is it cut for, CW or SSB
portion of the bands?

I didn't at first reognize the connection he had with the Hexbeam. John wrote a neat article on the homebrew hexbeam that I had read before deciding to purchase one of Mike's beams.

This duo antenna is working out well. It withstood 50 mile an hour winds beautifully last month.

More reports to come.

Suggestion:

Glad no one was hurt in your antenna raising mis-hap.

If your extention ladder, which you appeared to use as a raising fixture, can be spared temporarily or permanently, why not use the ladder AS the mast instead of the awkward telescoping TV mast. You can attach a piece of galvinized pipe to two or three rungs of the ladder and mount the beam and rotor to the mast (field day style). You can use TV antenna mount U bolts and clamps -- I used two different size clamps to configure a right angle mounting method, 4 clamps per rung and 2 U bolts per rung. I actually discarded the TV U bolts and replaced them w / zinc plated ones from my hardware store, using only the clamps provided. You'll have to come up with a guying and base mounting method for your particular situation. You should replace the ladder's pulley with a heavier duty one (can attach with U bolt) if you choose to use a ladder mast.

I cut down a LOT of sapling trees to make room for my installation and had a professional tree service come in and remove a high pine branch which was overhanging the antenna, before could break off in a snow storm and trash the antenna.

See my message # 1089 for my success story.

73,

Art

1190. Homebrew portable hex for 6 and ten meters

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-20 06:05:25 UTC
From: gschumac1 <gschumac1@yahoo.com>
Topic: 1190 Message: 1190

Hello all.

I have read almost every one of the posts here, to the point where I almost feel I know some of you people. HI. Unfortunately I am moving into a new home at the end of January so there is really little that I can do at the moment as far as decent antennas are concerned. Also unfortunately the new QTH has some restrictions that could limit my installation of ham antennas. I should have checked it out more thoroughly before I bought I guess however it was a good buy and exactly what I was looking for, other than for the antenna restictions.

I wanted to try the hex beam so I decided that I would build a 10 meter takedown version and then add six meters to it after just to get a feel for the interaction between the elements. I devised an easy to disassemble (I hope) design and have taken pictures of it as I go along, if for no other reason than to add to the information already here. Some others might be interested in building a version that easily disassembles.

I have a huge hill just to the east of me and I live on Vancouver Island which is about as far west as a person can get and still be in Canada. LOL This means that I have only got a decent shot at America to the south and then across the pacific to the west which limits me . I seldom hear much activity on ten (or any of the bands), unless it is coming in from directly south or from the West. I have made the hub and fastened the ridgid part of the spreaders to it and tomorrow (today by the time you read this likely) I plan to assemble the remaining (takedown) part of the spreaders and the elements. I am very anxious to see just how it works.

10 has always been my favorite band so I am hoping to catch a few stations over the next few days. The antenna will be pointed south (no rotator - too much trouble since I have to remove it all in 4 weeks or so)

I have a beautiful 3 element cubical quad that has occupied space in my crawl space (under house) for the last ten years and as much as I wish I could put it up, it is not going to be possible for a while. That Quad really works and I puzzle at anyone claiming they are hard to tune. (perhaps I was just lucky - LOL) Perhaps with the hex, painted to camoflage it, I will be able to get away with having a decent antenna that will provide the opportunity to make some contacts. I have only a random length wire and a vertical dipole for 10 meters up now.

Best of all, my new QTH (in Feb) is part way up the side of a mountain and I will have an open shot at the North, the east and to the south.

Unfortunatly I will have to hop over the mountain with a signal in order to work west, however this is far far better than what I have had for the last 3 years. I had been thinking of a GAP vertical but was still researching when I came across this reflector. My thanks to all who have posted here and provided such a wealth of information.

Garry -- VE7AJJ

1191. Homebrew Hex for Six and ten M

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-21 03:49:06 UTC
From: gschumac1 <gschumac1@yahoo.com>
Topic: 1191 Message: 1191

Good day to all. Here is a follow up on my attempt to build a portable, 10 m band, hex beam. Yesterday I manufactured a hub assembly and a means of connecting the spreader rods to the hub by using a simple slip together method. Today I completed the assembly and tested the beam on 10 m. I took pictures of each step as I went through the construction. I did not complete the beam installation until after dark tonight so I will get the final pictures of the hex beam tomorrow during the daylight. It is now installed above the roof of my house at a height of the approximately 25 feet. I got it up just in time to catch the dying moments of the 10 m band. I was able to make contact with a JA station (JA2GPR) and my signal report from him was 5 3 -- 5 4. When I said 73 to him a Z L. station called me, but the JA station was still on the frequency running a strong 5 9 signal and the Z L. was simply too weak to pull out of the qrm and relocate to another freg..

Some observations that I will make pertaining to this hex beam antenna:

1. I was totally amazed at the S. W. R. of the antenna. I designed the beam to operate on the frequency of 28.5 MHz and the S. W. R. at that frequency is 1.3: 1. The S. W. R. at the frequency of 28.3 MHz is less than 1.5:1. The S. W. R. at the frequency of 28.8 MHz is 1.1:1. I did absolutely no trimming whatsoever.

2. The antenna definitely exhibits a measure of directivity. When pointed to the south powerline noise is approximately 1 S. unit. When pointed to the West, the powerline noise is approximately 4 S. units. (This observation was made while the antenna was still sitting in a garbage can on the deck behind my house. This is the location I had to use to build the antenna.) Once the antenna was elevated to above the roof, the powerline noise was substantially reduced. At that height I am slightly above the height of the powerline's. I did not install a rotator under the antenna. Basically my options are to aim into the south or to the West. Directly to the east of me is a large hill that must be at least 400 feet in height. I have an extremely difficult time to hear or work any stations directly east of me. The other factors that influenced me not to put up a rotator is the fact that I will be moving to a new Q. T. H. at the end of January, so I will be taking down the hex beam in about a month.

3. I had the opportunity to compare the hex beam on receive against a 10 m vertical dipole and an end fed inverted L. that I use for all the lower bands. With the hex beam located on the deck well below the height of the other two antennas signals were at times equivalent but mostly less than those received on the other two antennas. Once the hex beam was elevated to its location above the roof I was able to

discern a definite improvement over the vertical dipole and in many cases an improvement, though less, over the inverted L. antenna. (Because of the length, the inverted L. antenna likely exhibits a certain amount of gain on 10 m). Without a rotator it is a difficult to ascertain what degree of directivity I am getting. I'll leave that until I am able to re-establish myself at my new location.

4. When I transmit on 10 m I totally wipe out the television. We are using a satellite system and the antenna is installed about 10 feet directly in front of the satellite dish. I did not install a balun at the time I installed the antenna, there again. it was because of the limited length of time that the antenna will actually be up over this house. Also I do not watch television, particularly during the daytime, if at all. The wife watches television after the evening meal and the 10 m band often has died about that time so frankly I don't see a problem with this and can live with it for the next month.

5. It was my intention to install a 6 m beam within the 10 m beam but I likely won't bother with that until I get relocated to my new location. And when I do get settled in I expect to build an entirely new antenna that will at least have the 15 m band on it and possibly even a 20 m band.

Basically I am pleased with the performance of this hex beam. I seriously doubt that it would compare very favorably with my three element quad (packed away in crawl space right now) however it is decidedly a tremendous improvement over what I have been using (vertical dipole). One thing I truly like about it is its small size. Nobody would ever consider that three element quad to be even the slightest bit "stealthy" but this thing has a really great chance of remaining unobserved.

Hello,

I?m new to this group, my name is Paulo Marcondes (PU2PIX), from S?o Paulo, Brazil.

I like to tinker with antennas, and this kind of hex-beam seems worth a try...

I first read about them on EI7BA's pages...I also read a lot on the group's home page.

lets have fun!

BTW,

seasons greetings

From: Bernie_Gardner <w1az@arrl.net>
Topic: 1193 Message: 1193

I have a Traffie HX-5 antenna. I had to do a little reconstruction and while it basically works, the minimum swr is offset, particularly on 20m. I have the cw elements, but the minimum swr is around 14250 and swr is over 2:1 at 14000. I can't see anything obviuos and the only thing I can imagine is that I got the spacing of the elements wrong. Is it possible someone could send me the correct spacings? (0r make any other suggestions?)

Thanks

Bernie

More observations with the hex-beam:

Today I had a bit more opportunity to check out the hex beam against my 2 other antennas. The beam consistantly outperformed the inverted L and the dipole on receive. I could see a difference on average of about 3 S units compared with the vertical. Low level signals disappeared entirely when I switched to the vertical from the hex beam. (Note that the vertical is now lower than the Hexbeam is) The same was true with the inverted L however the "L" outperformed the vertical for the most part, but there was decidedly a difference of 2 or more S-units from the "L" to the Hexbeam.

I am quite pleased with the performance of the Hex on receive at least. I have not had as much success on transmit yet though. I called CQ a number of times on the band without response. I answered a CQ from an Alaska station and received a 5 x 6 report off the back of the beam. The QSO was short though due to QSB. I think the band was just starting to open to the north and still was marginal.

As I type this I am listening to a VK station in a QSO and the VK has a signal of 7+ S-units. I have never been able to hear the VK's or ZL's at that strength previously, at least not from this location. I can't wait to try it with a rotator, to ascertain the directivity. HI.

The antenna is really not the least noticable over the house partly due to the flat black coloration and the fact that the backdrop behind my house is hill and trees. I doubt that anyone driving past would ever notice it. It appears as though it will be ideal for my purposes. Now all I need to do is wait for the move to the new location and cobble up something better (more bands?) for there. Many thanks to all of those who walked this trail before me and shared the information. I have pictures of what I did for any one who might like to see them.

Hi Jason,

It should be thought of as a RF choke to stop current flow on the exterior of the coax shield. You can read more in such books as "Reflections II" by W2DU. I suggest you use 5 or 6 Type 77 or 73 beads just below the base of the Hex-Beam. They shouldn't be any higher. Type 31 is an alternative, but I am not very fond of its lower Curie temperature. Type 43 (what you find mostly) is very good at HF. I had to use a dozen before I got the 73/77 one. Even then, the performance was lesser. If you have more questions, let me know.

BTW, Traffie has stated in the past that a balun isn't necessary with the Hex-Beam; however, he was talking about one for impedance matching. Mike agrees with the RF choke.

Jason,

Looks good!

Just got my 5-band Hexbeam the other week and haven't had time to work
on it with Christmas and a cold.

Plan on getting to it after the holidays.

Best to you and your family for Christmas and New Years.

- Bill N3LLR

Barry:

I ordered the RF Chokes after I got my antenna, and then couldn't wait to get it up so just tightly wrapped 8 turns of the coax directly under the feed point.

Its working great but.....I have the chokes now, would you still recommend me putting them on? What problems do you notice operating if the balun is deficient?

Hi Paul,

Every installation is a bit different. First, I hope you meant that the choke is below the base of the HB. The coax balun does work, but it is significantly inferior to the ferrite beads in bandwidth alone.

I would suggest that you swap out the coax choke for the beads. I hold my beads in place using heat shrink. The clamp-on type can cause problems down the road.

Problems you may observe sans a RF choke are RFI issues, odd SWR readings, feed line radiation, etc. For example, I would get into the company phone system at times on 17 m even with the earlier Type 43 balun or the coax balun. With the Type 77/73 banum, that problem has gone away.

73,
Barry - W4WB

Hi Barry,

Where do you buy the type 77/73 banum?

Hi Bill,

See http://www.amidon-inductive.com/associates_prodselection.htm

I use FB-77-1024. Price is $2 each. I am looking for a direct
source overseas for a better price in bulk.

73,
Barry - W4WB

I should probably put these things on as well... getting RFI in my computer speakers (which usually happens no matter which antenna I use..) The RFI is coming through the amp in the speakers as it goes away when I turn them off.

However... How do you install them when the coax is already up? I have the connector sealed for weather... do they snap on or do you put them on the coax before you put the coax ends on...

Also, do these go around LMR400 cable ok?

Thanks!

Jason

Jason,
Likely you need to put ferrites on your computer speaker leads
nearest the speaker. The ferrites I specified are a cylinder with a
0.5" hole. Snap-on can cause a problem. Perhaps you can cut the
connector on the shack end, feed the beads and heat shrink up the
coax to to just below the HB baseplate, and then afix the beads and
heat shrink. Put the connector back on the shack end. I don't know
the OD of the LMR400.

Topic: 1212 Message: 1212

Hi Guys...
I have been following the posts for a little while now, and I think I have the necessary info to start my multi band project.
There are one or two questions that I do have however...Maybe some one has answers for me...
I will be building from scratch, (comercial offerings plus freight to ZL land are prohibitively expensive) so wonder if any one has done any work with bamboo sealed with fibreglass tape and resin for the spreaders?
When using the formulae for element lengths, is there an optimum diameter for the wire?
When it comes to building the center pole, what are the advantages or disadvantages of a single feed to parrallell connected elements vs individual feeds from a relay box below the hub.
I like the concept of internal harnessing to studs, but is it necessary to have studs for the reflector elements? (I am considering a full length element possitioned at the center pole with a sadle.)
Finally, in the last few posts there is mention of ferrite cores for building a balun.....Could some one please suggest a supply house which would forward these against a VISA order?
Many thanks in anticipation, and enjoy the festive season.

1214. Homebrew Hex-Beam in ZL

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-26 22:59:58 UTC
From: David Douglass
Topic: 1214 Message: 1214

Hi Graham,

In answer to your questions..

1. Bamboo coated in fibreglass should work FB, but from previous work I've done on a quad these can be quite heavy. I don't know if there are any cheap supplies of fishing rod blanks over there, but these should be you first option. The total spreader length needs only to be about 10 foot or so, even treated lengths of dowel or PVC pipe could be used. I have used 8 foot lengths of dowel, extended to 10 foot with short lengths of Al tubing)

2. As with all antennas, wire diameter with slightly effect the length of the elements, but the main consideration is that the wire provides a lot of the tension on the spreaders and therefore needs to be strong enough.

3. I tried both single feed and multiple feed, and would recommend the multi-feed system. It's easier, cheaper and in my case, seemed to perform slightly better (although I didn't do any direct comparisons)

4. Your correct, a single length of wire fed through the centre post is fine for the reflector, no need for studs (although these do look pretty)

5. I've ordered ferrite beads and cores direct from the US with VISA, see

http://www.amidon-inductive.com/associates_prodselection.htm (address courtesy of Barry)

alternatively I could give you some addresses in Australia if your interested.

OK, good luck Graham and hope you can assemble the parts. If you haven't already done so, check out the design by Holger, DL7IO in the YahooGroups Files area. This is the best set of plans I've seen for a HomeBrew Hex, and if you stick closely to his overall design, you won't go far wrong.

Regards

David, VK2DPD

From: Paulo Marcondes
Topic: 1216 Message: 1216

Hy guys,
Graham has posted a question regarding use of a relay box to feed his antennas...

What I would like to know is how does a relay box perform... Since I?ve read EI7BA's page on his relay box I am considering building myself one.

I would like to hear impressions from those who have tried such system. Is it worth the hassle of building? I am (maybe too much) concerned about putting time into building something that eventually won't work. As I do not have the necessary electrical/electronic expertise, I would not even figure out what is going wrong...

Hi gang,

Wanted to let you know that the Hexbeam is performing as expected. I had a quick QSO with Doug, W6HB and it appears to be working fine. It is a little noisier than I expected, however, I am able to notice a difference in F/B, F/S, etc. Also in signal strength. I also noticed how bad my vertical is :) I have an inverted V about 30 feet away from the hexbeam and the feedpoint is about the same height. Also, power lines are also at the same height so I am sure that is the case.

Anyways, I am pleased so far... I contacted a station in Malta with it as my first DX contact. I got a 57. He was also about a 57 as the band was shutting down. On CW, I notice a big difference! Which is exactly what I want.

I have yet to dive into a pileup with it, but that will happen soon! Will let you know how it goes..

I tried to upload my new tower photos to the photos section but it says there is an error when I try to upload...

See ya guys!

Hi All. I too find that the atmospheric noise is higher on the Hex beam (mine is homebrew though, not commercial) Still I can hear signals on it that simply disappear completely or become un-intelligible at any rate on the vertical or inverted L. My rig has a preamp on receive on ten m and all that does is increase the signal AND the noise, not really improving intelligiblity but the hex definate seems to improve the signal more than the noise. I seem to recall that there usually is a correspoding increase in atmospheric noise when an antenna peaks near resonance. 73

From: David Douglass
Topic: 1225 Message: 1225

Paulo,

Relay boxes work fine as long as you can get relays with a good enough rating to do the job. However, if you are thinking about using one to feed the elements individually on a 5 band Hex-Beam I would recommend against it, as I don't think there is any advantage in feeding the elements seperatly.

Regards

David, vk2dpd

1227. D88S Recording on Hexbeam and Dipole

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-28 02:00:44 UTC
From: Jason Hissong
Topic: 1227 Message: 1227

Hi guys,

I contacted D88S on the Hex tonight and I recorded some of his signal for comparisons. You can hear from the recording that the Hexbeam is what enabled me to get the contact. I got him on SSB on the third try... This antenna will actually allow me to work SSB DX now!

The dipole is an inverted V with the feedpoint at 35' and the ends about 10'. The Hexbeam is at 36'. This was done on 15M.

I am hooked!

Recording available at http://www.qsl.net/n8xe/radio/wavs/d88s_hexbeam.mp3

You can also hear from the recording how noisy my Hex is compared to the dipole... but I am not complaining too much! I could not even hear the station on the vertical.

I even heard long path for the first time tonight. I heard a VK4 station louder on long path than on short. Never heard that before.

73 guys!

Jason Hissong

From: Garry <gschumac1@yahoo.com>
Topic: 1228 Message: 1228

I was watching the news tonight and they showed the wind blowing out across the golf course. Hmmm. The wind was whipping the flag on the green. I looked up this site

http://www.coursigns.com/golf-course-flag-poles.htm

and discovered that the 8 foot flag pole, one half inch diameter, is $11.50 us and the three quarter inch one is $24.50. It would seem that they might make a durable spreader for a hex beam. Another site had no pricing but indicated that the poles could be had in 10 and 15 ft lengths, better suited for the 20m version.

Thought I might pass that on. Every country must have a golf course and supliers for the golf courses....

1231. Source of Noise

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-28 14:56:15 UTC
From: Jason Hissong
Topic: 1231 Message: 1231

I think I found the source of the noise... Barry, W4WB, suggested that it sounds like power line noise when her heard my sample. I tried a little experiment... I pointed the beam due north where power lines are parallel to the antenna about 50-75' away. Sure enough the noise is high, S5-7. When I point it ESE, there is very little noise, S3. When I point it due south, the noise comes back about S4-5. So it looks like power lines. Ok, now I know what it is, what can I do about it? Even with the noise, this thing rocks.

73,
Jason

1232. RE: [hex-beam] Source of Noise

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-28 15:49:55 UTC
From: Peter's Mail
Topic: 1231 Message: 1232

Jason,

Great to see you're having fun with your Hex Beam!!!!! I experienced the same thing at my QTH - Lot's O noise following the erection of the Hex beam - While my multiband dipole is approx the same height I found both wanted signal level & NOISE appreciable higher with the Hex.

Living by the ocean has its challenges when it comes to power company utilities keeping up with maintenance. I've been working with the power company, ARRL RFI reps and the FCC for about a year and a half to get resolution. The power company has "professional" RFI guy - after a bit of training on my part he does the best he can do. The problem is mostly with the line crews as they operate separately from the power company radio guys and at a snails pace. Instead of coordinating the line guys will respond sometimes months after the PC radio guy has identified potential problem poles/equipment and not have the radio guy involved during the "repair". They don't know if they really repaired the problem or not! It's a vicious cycle.

I original did a drive test with an AM car radio tuned to 1700 KHz - Also an IFR service monitor - AOR 1000 scanner tuned around 135 MHz AM and a couple of other HT's to narrow down locations & poles. I identified 22 locations that ranged from arcing insulators to burning branches etc. Gave them the list and the game started. At one point they responded months later that it was not their problem to fix!!!! Mr. Riley from the FCC reversed that via official letter supported by the ARRL's help. And yes, I got action for a few weeks and a lot of yada yada in a letter from one of the PC Directors. That was over six months ago. Two weeks before xmas I received a call from the PC radio guy that he had a scheduled meet with the line crew one week b4 xmas - well of course nothing so far. They have fixed some but many other problems still exist.

Several things you can do in the interim while the PC reacts would be a Timewave ANC-4 DSP unit - touchy to tune but sometimes very effective - A clear speak DSP speaker would be another item to mask the problem.

Do go out and identify ALL possible noise sources - Start in your own home first! Shut down ALL AC power to your HOME including anything that may run on batteries like alarm system - Run your rig on DC and bring up each AC circuit one at a time. Once you've documented any noise sources internal then arm your self with 1.5 MHz AM thru 500 MHz receiving equipment and walk / drive the neighborhood. Write down pole numbers and a description of each noise identified. Report this to your PC ASAP and insist on a number or call back from the Radio Interference group of the PC within 24 hours - Keep accurate notes of ALL conversations and discoveries including names, dates/times and commitments. Subscribe to the rfi@... list

server and read ALL achieves.

Good Luck and welcome to the world of HF

From: w4wb <w4wb@arrl.net>
Topic: 1231 Message: 1234

Very well-stated and explained Ren. If you have a noise blanker on your radio, give that a try. It may or may not help. The FT-817 NB is iffy as designed (mod works better). My FT-1000MP NB works much better while the FT-100D NB is the best I have seen.

I should note that the NB could potentially reduce the symptoms, but is far from a cure. One thing that is happening is that the front end is getting loaded and that can hurt your overall performance!

Let me suggest that you get a copy of the January 2003 issue of CQ Magazine and read the article on page 80 by my friend Dave Ingram K4TWJ. The title is timely --- "Power-Line Noise - Its Causes and Cures." As Ren pointed out quite correctly, you can become an RFI hunter by having the right tool. 135 MHz AM receiver (repeat -- AM) is the tool of choice. Ren has an AOR while I have a Yupiteru MVT-9000. MFJ also offers one called the Line-Noise Meter, MFJ-852 for $100 (list -- WB0W Enterprises offers MFJ stuff for a nice discount).

The ARRL also has a book called "Interference" that I recommend for reading.

Happily, my local power company is very customer friendly and the RFI guy also works closely with the repair guys. In our case, he orders up a crew and they "work for him" during that task assignment. This is much different than Ren's PC behaves (and is perhaps more typical). Our RFI guy has some fairly good equipment and understands how to use it. Also, I know that the line crews seem to understand things that cause noise sources. They keep "recent samples" of problem devices they found to show to others.

My primary station (meaning where the Hex-Beam is located) is at my office, which is located in a light industrial area with above-ground utilities. This is a much worse environment than most residential areas. However, over the past year, we have reduced the noise from as much as S-9 (measured on a calibrated FT-1000MP) to generally S-0 (or just atmospheric noise mostly now which can be several S-units or more). We located sources at first over two miles away that were radiating over the lines. As one set of sources were eliminated, others appeared. It was like peeling an onion, layer by layer. I should again point out that my PC RFI guy just hung in there to solve the problem. Also, I note that RFI problem solving isn't Job 1 for him, but he gets it done anyway because, as he says, "It's the right thing to do." Once we got the Power Company's noise source solved, the noise was still at S-5. We located (using the Hex-Beam and the handheld units) the source as a telephone company in-line boot. Some of the connection has become "noisy." Working with the telephone

company is pure magic. PC guy makes a request to some 800 number, you wait, no feedback, and then the problem is solved, and no feedback as to why. Who cares? It was fixed! That got the noise down to S-1 to S-2 (when atmospheric noise was quiet). We found a few more problems with machines in buildings nearby (like compressors). The RFI guy went to them, told them of the problems, and the folks got it fixed. Noise went to S-0. Woooohooooo!

Recently the noise jumped to S-9 again. The RFI guy located the problem (using a ZAP Checker for real close in hunting) at a number of buildings. Turned out that it was the some of the power cubes for Knology Internet interfaces and some of the interface units themselves. When he talked to Knology, they started replacing the faulty units (a lot of them too) without complaint, but actually with a thanks for identifying this problem! Folks, I really have some fine neighbors here that believe that it is their responsibility NOT to interfere with others. I could cite a number of other problems identified including a switcher at a major company that was replaced due to RFI. Notice that our PC RFI guy goes well beyond the "Power Company's Responsibility" and deals with the total problem. Does he do this just for me? Nope! I know many, many hams he has helped. Solving these types of problems can take significant time, but understanding and patience can yield great results.

As Ren mentioned, the ARRL and the FCC are also tools. The FCC has never contacted our PC. Most likely because they already have that "Can Do" attitude and realize they need to provide good customer service. FWIW, Huntsville Utilities is owned by the City of Huntsville, which means the elected officials get blamed if we voters get upset at the PC. ;-)

My only other advise is to get to know your local RFI guy and help him to learn more about identifying noise sources. He can also teach you a few things too I bet. My RFI guy certainly did teach me some!

73,
Barry - W4WB

Hi David,

Thanks for answering. No, I don?t mean to feed the hex elements
separately... For me (BTW, I am no antenna expert) it seems clear that,
no matter what feed system one chooses to use on his multi-band hex,
there always will be some mutual coupling between the elements.

Jason,

I have had powerline noise problems and the utility company eventually repaired the bad components. In my case once it was a bad insulator and another time a bad transformer. I thought I was going to have a real fight, but they responded quickly.

Barry,

I am thinking of building my own 6M beam (although, the commercial version will probably be bought). This question is for the group as well...

I notice that all of the Hexbeams use the flexible supports that point up to hold the wire. I can understand that for multiband antennas this is a must. However, what about for single bands using pvc pipe? Kinda like spokes in a wheel? Will the pipe affect the performance that much? I guess another reason to use flexible piping is for the flexibility in spacing and adjustments...

Jason.

I think it is desireable to create tension on the wire, thereby holding it taut, by bowing the spreaders. The effect might be compared to that of a "bowstring" on a longbow. (though that degree of "taut") is not required just to keep the wire aligned. If you use a nonconductive material for the spreaders there is little likelyhood that there will be any interaction between the spreader and the element. I expect that the antenna would work just fine if a rigid spreader was used with some type of bungee cord to create tension on the element for the purpose of keeping it well aligned.

1240. Hexbeam lite

Yahoo group: hex-beam (2001 — 2006)
Date: 2002-12-31 23:33:39 UTC
From: w5ddc <dallas@aol.com>
Topic: 1240 Message: 1240

All,

I will attempt to post a couple of pics of my Hex beam experiment. I am using 3/8 inch heavy wall tubing and 1/4 inch solid aluminun for 4 of the 6 spreaders. These will be driven directly in lew of the wire element. The remaining 2 spreaders I have obtained from the local Walmart 2 six foot fishing rods for 6.94 each. The center insulator is a 4 inch PVC pipe cap which I have mounted on a 3/4 inch floor flange. I used 1/4 inch stainless steel bolts spaced about 2 5/8 inches on the cap as mounting studs for the spreaders. Its not all together in the pics, I just picked up the fishing poles.

I'm going to try this all out as a single band first then experiment with the element as if it were a parrallel dipole. I used number 9 cord (telecom guys know this stuff) to tie it all to the kingpost at the moment.

So far I have 30 bucks in aluminum from Texas Towers. 14 bucks at Walmart for the fishing poles and another 15 bucks for the hardware. I will take more pics as the project goes together. My only concern at this point is how survivable it will be with these element sizes.

Jason,

Search the archive for K0TRL (Brad). He built a 6-m HB last January. There is a photo in the Photo section that shows it coated in ice.

I measured mine for the "bow" today. The distance from the center of the arms to where the elements connect to the mast is 5 inches. The arms are different than the 5-band HB and are rahter stiff. Brad had much more bow, but his arms were more flexible as I recall. Do look up his posts.

As usual, all that is important is to get the element lenghts and spacings correct.

GL!

Im planning on using aluminum wire for the element ends to avoid
electrolysis from the junctions. I plan on feeding the elements at the base
of the
PVC cap. I have the fishing poles cut down and need to extend them about 3
feet
on each side to get me to 9 feet or so. Im hoping to try this on 20 meters
and above. I will try it as a single band first, Im guessing that multi
banding in this
feed configuration will cause a great deal of interaction between elements.

Hello everyone,

Ive posted some more pictures of my experimental hexbeam.
You will see better pics of my hub configuration and some pics of the
compression slip joint I have devised for the aluminum elements.
I am using 3/16 inch compression union nuts that I have drilled
the center to allow them to slide on the 1/4 inch rod. I tapped
the 3/8" tubing with a 3/8-24 die then slotted the end with a
dremel tool to allow compression of the fitting when the nut
is snugged up. This allows me to adjust the length of the spreader.

I have the fishing poles cut down and fitted to 3 foot lengths of
3/8" tubing which then terminates to the hub. I ran out of daylight
before I could get them assembled. Again my intent is to configure
this as a single band antenna for the initial trials.

Donlin.

You are taking a very innovative approach. I certainly will follow your trials with a great deal of interest. Certainly the single band version will work but it is the multiband one that attracts my interest the most. I also considered the same method you have elected to use however I opted for the more standard construction method.

I rather like the idea you came up with for the hub. I only hope that the hub won't deform over time in the hot sun when you have applied tension to the spreaders, that is if you apply tension to the spreaders, such as is typically done with the multiband versions. It may not be necessary to do so with the method you have elected to try.

It occurs to me that a short length of pipe glued into the cap could aid in reducing the amount of distortion that might occur over time. I am only speculating about the distortion however it has been my experience that warming plastic pipe while it is under tension causes it to take a set coresponding to the tension.

Keep up the work, it looks good to me. Ten meters seems to be dieing so I will soon have to get after a multiband or at least a 20 m version HI.

Had a little time to work on my Hexbeam and have proceded with configuring the antenna for 15 meters as a trial. I have to decide on a method of attaching the wire portion of the elements to the 1/4 inch rods. I epoxied in the kingpost since I had to rough out a hole in the top of the PVC cap for the fitting. I found that the 6061 aluminum is soft enough to deform under the bow tension. I have added hose clamps at the hub end. I may change this later. As noted by Garry, the longevity and durability of the PVC cap is a question, my biggest concern is ultraviolet deterioration from sun exposure. As Garry suggested, it would be possible to glue in a short section of pipe or I have found a 4 inch to 2 inch adapter that would add substantial mass to the hub.

Hi Hexbeamers:

A friend of mine has become very interested in 160 meters and has built a 160 meter dipole, two (notice, two) Beverage antennas of 580 feet each and a magnet loop listening antenna.

So I thought I wonder how the 5 band hexbeam "hears" on 160 meter. I was surprised to find that with my 756PRO auto antenna tuner it "hears" quite well on 160 meters. I have no plans to try to transmit with it on 160 meters.

Just thought you might like to know about another interesting use of the Hexbeam.

Dear Abbey,

Last night this station and another near LAX were in QSO with a W7 in Oregon. This station runs a 100 watts into a lowly Hexbeam (challenged, compromised set of dipoles) at 30.' The station at LAX was running a TA-33 at 33' and 100 watts. The path was comparable and the frequency was 14225. This station's report was a solid "S" unit higher that the other LA station throughout the 45 minute contact. My signal was reported as having minimal QSB while the other's was extensive. My audio was more reported as more "solid." The W7 was a male in his 70's who has been licensed for around 50 years, has two QTHs with multiple antenna and was running only a G5RV during this exchange. I can no longer tolerate the stresses caused by circumstances such as this. What should I do?

Distressed with Dipoles

Yes, guys this is a true story but posted for comic relief only! No flaming required, thank you - Doug - W6HB

Hi Garry,

I had to pause after getting the last pics uploaded and fix my TS-940S.
I had a connector on the voltage regulator board smoke and take out a
transistor driver. Got it working this week. Now I just need to hike the
antenna up the roof and give it a try. If you look at the pic files I had some
more recent pics of the hex with all 6 spokes arranged. Its survived the gusty
winds here in Texas this week so thats a good sign so far.

Thanks for recording the sounds. The NB does seem to take care of the noise, but I am sure it also attenuates the wanted signals a bit, too. I think the lesson for me is that RFI is really everywhere.

I live in a rural setting, but have high-power lines (the ones with the massive steel towers) crossing the corner of my two acre lot. I get some noise from the lines -- it seems to be humidity dependent.

Thanks again, Jason.

Chuck, AK6DV

Topic: 1258 Message: 1258

Traffie mentioned to me today that he is planning to offer a HXL-1520 (I think this would be the number) Hex-Beam. It will be the light-weight version for 15 and 20 m. The price will be $399. By comparision, the heavy-weight version of the 15 & 20 m HB has a price of $599. $200 less looks like a good deal if you don't have to put up with lots of ice.

Also, he told me that he and Kathy will be showing at the Orlando Hamfest. This was a last minute decision. Drop by and say hi if you attend that hamfest.

1259. Additional band coverage?

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-01-14 17:06:46 UTC
From: wa2ntk <wa2ntk@earthlink.net>
Topic: 1259 Message: 1259

Hi to all group members.Name is Ralph, call is wa2ntk. Live up state NY in the Finger Lake region of the state. I'm new to the group and have a 5 band Hex beam at 37ft. Been using it now for about 18 months. The antenna is located on the floor of the valley 932ft above sea level. The surrounding hills are 1,000 ft (2,900ft)above the antenna. The antenna has withstood the wind, and ice storms of this region without any damage or loss of performance.
As an airline pilot I have a very bust life style that does not afford me a lot of "radio time". Most of the time I have to devote to Ham radio is spent just "tuning around" the bands. Since I have the beam up I have worked 64 additional entities (for a total of 205).
My base rig is a Kenwood TS930S-AT with a maximum output of 140 watts. I do not own a linear amp and therefore always
run "barefoot". .
Last weekend I stumbled upon the following. The Kenwood TS930SAT will tune the beam on both 75 and 40M providing a very low SWR and full output. Also at these frequencies the antenna becomes omni-directional??. I had a 2 contacts on 40 and 6 on 75M and the signal reports I am getting are the same as I'm seeing on the TS930. On receive the performance is at least equal to or most times better than my Zepp antenna. Has anyone else experienced this? I tried using my Icom 706 MKIIG and it will not tune the beam on these frequencies. I was both surprised and pleased to discover I could do this with the 930.
I'm curious and would like to know if anyone else using this antenna is capable of tuning these bands and if so what radio are you using?
Thanks for your input.

1262. calculations - feet, inch , meters...

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-01-14 23:26:16 UTC
From: ddelft2004 <ddelft@zeelandnet.nl>
Topic: 1262 Message: 1262

Hi There,

I would like to ask if someone can point me in the right direction for calculations on the Hex Beam.

I've seen a lot of different formulas with results in inches, feets and meters, but all have very different results. Especially the formulas for the Tip-space of the driver and reflector differ a lot.

For example: A complete calculation of a Hex-beam can be found at EI7BA's website: http://www.qsl.net/ei7ba/ahexbeam.htm

a lot of people mention that the reflector should be 4-5% larger than the driver. OK.... calculating the above examples shows that the reflector is only 1.4 % larger than the driver, which i think is incorrect.

Can someone tell me what there experience with these calculations are ?

Thanks in advance....

D.v.Delft

D.v.Delft

I think those figures are pretty close.

Since you are here, look to the left of screen and click on files then check out DL7IO and I think you can get the info you want from there. If I recall correctly, I used his formula to calculate the dimensions and MY hexbeam (single band - at the moment) was bang on. I did no trimming whatsoever (as far as swr was concerned).

And does it work? Yep I worked a ZL2 and a VK3 just yesterday morning using 10 watts (mode - psk) and neither of them was moving my s meter period.... Mind you there were no other signals on the band at the time so no competition.

Tony I think the base dimensions are arbitrary, depending on what you want to build. All the information that you want can be found right here but it does take quite a bit of reading HI.. I suggest you try the files and photos section of the reflector. I think you have to be registered to access them but I'm not certain of that.

Good luck.. Happy reading (I read them all ---- well most of them anyway. You soon learn which are of interest for your application)

I stuck an excel spreadsheet file with the formulas for element lengths on the group files page.
The formulas were derived from the EI7BA web page. If anyone can comment as to the accuracy of these formulas it would be appreciated.

You just enter the frequency you want to see and it auto calculates the elements and spacings.

I have owned a 5 band Hex beam for awhile and have used it in our retirement travels including Mexico, St. Paul Island, Labrador, St. Pierre and Miquelon. I am thinking of giving it to my son and buying another one. Given that the sunspot cycle is headed down I am thinking of getting the 20 - 15 meter model rather than the 5 band model. The main reason for that is discussed below.

Having put the 5 bander together and tearing it apart many times the xyl and I have it down to about as much of a science as possible. One thing I may do is put sleeves where the fiberglass poles mount and have the sleeves so I can slide the fiberglass poles into the sleeve. I would have the end of the sleeve slip and use a hose clamp to hold them. Those locking nuts and angle pieces are the biggest hassle to a quick portable install. The biggest secret we have learned for a quick portable install is don't take it apart. By this I mean leave the director wires mounted and just take the pole apart at the slip joint, fold it one over so they are side by side and fold the the wires with it, DON'T WRAP, and use tape to hold the wires along the poles. Do the same with the reflector and the other poles just slip apart and tape together. BTW for the joint we just use black tape and works great for a couple weeks install and have been through a major storm on St. Paul Is. I also have a quick attachment to the mast which takes 5 seconds. My mast is a 20 or 25 foot push up flag pole. I also have designed a base mount for hand rotation and locking in a certain direction. It put it all in a nylon bag other than the hub. If there is interest I can go into all this and post some digital pictures on the web..

Obviously one could put it up faster with 3 bands rather than 5 bands as that is what takes the most time, hooking up the wires. I don't know how the matching is done in the "TUBE" but has anyone TRIED JUST PUTTING ONE BAND WIRE ON or does the SWR go up? That would really speed it up. A lot of times I just want it on 20 meters to get my e-mail and keep some schedules. I don't want to buy just a mono-bander as I might go on another DX-pediton and at least want 20 - 15 meters and some times we stay a few weeks in one place and then it is worth the effort to put the other band wires on. If the matching is critical in what is done in the tube(I suspect it is) does anyone know what it would cost to buy a 20 meter center piece or build one myself so when I was putting it up for just 20 meters I could use it instead of the multi-band tube. I like this idea as then I could buy another 5 band HEX BEAM but a lot of the time just put it up with the 20 meter wire on it and the 20 meter center post..

Summary:

Has anyone tried leaving band wires off and what is the SWR?
Has anyone built or know if I could get just a "20 meter tube" for the center section?
I would be interested in information on how to build a "20 meter tube"?

It is 9.5" across the plate and each side of the Hexagon is 5.5" of my 5 band Hex Beam base.

I have not used the 20 mm PVC but I just don't see that working. There is A LOT of force when you put the band wires on. One can do a lot of things to home brew one but not using fiber glass poles in my opinion would not be one of them.

Folks,

Many of you have joined this Group and have never posted. When you do, you may be surprised that your post often takes a while before it shows up. Some even repost it thinking Yahoo! put it into the black hole.

The problem is that you are in a moderated status. I do this in order to allow anyone to join, but not to have the priviledge to freely posting. Why? Simple reason is to be sure you are not a spammer. Yes, I catch one or two a day trying to break through so that you never see them.

So how do you obtain unmoderated status? Simple again. Just post a message that clearly lets me know that you are a ham and are interested in this antenna technology. I encourage you to sign the post with your name and call sign. Once I see you are not a spammer, I then change your status to unmoderated. From then on, your posts will appear as fast as the Yahoo! system moves them along.

This list has NOT had "bad behavior" yet unlike two other lists I manage (having a total of over 5000 members). In some cases, people are placed on moderated status, and if they don't "get it," they are banned and/or removed. This is an excellent group and your interest in helping each other is nice to see.

So be tolerate of me if your first post takes a while to show up. I have a busy life and many other duties. In general, I try to check the pending message box each day.

Thanks es 73,

Hi Ed,

Great information. For fun, I tried the 5-bander mounted maybe 6' off the ground with all bands connected and then took off the 12 and 17 m wires. Why? Beats me, just seemed interesting to do at the tiem. Anyway, the 259B scans showed that it wasn't such a good idea. Lots of interaction going on and you have to remember that all of anntenas are feed at the same time.

For your travels, it sounds like Mike's planned HXL 15 and 20 m would be just the ticket.

Hi Barry,

OK that explains why my posts were not going through today! I am farmiliar with moderated and unmoderated and after the postings did not show up I checked the information on the Yahoo page and it said unmoderated so I decided that was not what was holding it up. I guess more accuratedly stated not moderated after the first time if you meet the criteria. No problem, sounds like a good way of doing it and I appreciate your efforts. Boy I have been around a few that I sure wish were modereated.

Thanks for the explaination, now it all makes sense and I am all for it. AGAIN THANKS! I assume I am now on unmoderated status.

HI Jason,

I think it is likely Mike will be there. Not definite yet, but
likely. BTW, got your QSL and mine is on the way back tomorrow. Not
a bad Hex-Beam drawing you did. ;-)

I will be at Dayton and can be found at the W4RT Electronics booth
(113 & 114) selling lots of goodies for the FT-817, 847, and 897 plus
LDG tuners of all types (some new models too). Drop by and have an
eyeball QSO.

Hi Tony and All,

Regarding PVC pipe, I would tend to agree that 1 length of 20mm PVC pipe would not have the required rigidity. I would suggest looking at telescoping some shorter lengths together and think this would give you the required strength and flexibility.

I'm looking at this for my MarkIII version!! I've been thinking about hose clamping the lengths together, so they can be telescoped down for transportation, and instead of using 2 U-bolts to fix the spreader to the base, using a U-Bolt on the outer part and a hinge on the inner part to allow the spreaders to 'fold up'. This would allow you to easily transport the antenna for portable work, and have it set up in minutes at the other end.

Sounds good in theory anyway.

Good Luck

David, VK2DPD

Pursuant to your received request, I make this posting to substantiate that I am not a spammer. I joined this group because I have an interest in this particular antenna and was hoping to learn more about it, and possibly how to home brew one. Have not had the pleasure of actually seeing one of these first hand. Am sure its components are of highest quality. But for the life of me, I still wonder what it is that makes it cost so much. I have been just reading all the posts, absorbing as much as I can. I considered buying a hex beam, but it was so new at that time, I could find no one who knew anything about it, much less actually possessing one. I bought the Cushcraft X-7 instead. My take is that the X-7 is superior in that it is extremely heavy duty in construction and probably exhibits more gain pjrovided one can get it tuned just right. Believe me Cushcraft does not cooperate in this endeavour. Nonetheless, the hexbeam still fascinates me. I am even more fascinated by the newer small beams being offered that use eletric motors to adjust the element specs instantly so one is virtually always using a reasonant antenna. I forget the name of these just now, but they too, are quite expensive. Were they to make one with at least one more element, I would indeed consider investing in one to try it, provided that investment is one I can actually make! Bill Tarkington/k3yc.

> Am sure its components are of highest quality. But for the life of me, I still wonder what it is that makes it cost so much.

From what I've heard, it is primarily the cost of labor. Other antenna designs are mass produced, at lower cost. I'm sure the Hex could be made at lower cost -- but probably not by Traffie.

> My take is that the X-7 is superior in that it is extremely heavy duty in construction

Note that the X-7 is heavy duty because it has to support it's own weight. I selected the hexbeam because it is very strong for it's weight. In winds that bent my VHF vertical, the hexbeam didn't even flex. YMMV, but my hex scoffs at ice-storms and 70 mph winds.

> I am even more fascinated by the newer small beams being offered that use eletric motors to adjust the element specs instantly so one is virtually always using a reasonant antenna.

The SteppIR antenna suffers from the same weakness as conventional trapped tribanders -- the element spacing isn't optimized. As a result it does not exhibit great F/B on the higher bands. Same as it ever was -- same problem, new product. Still, it is a step in the right direction. A motorized telescoping mast that changes the element spacing would be trick.

Topic: 1290 Message: 1290

Hello everybody. I found some questions where I may give a comment on and will answer them in one posting.

Hello D.v.Delft,
you will get the antenna working while using EI7BA's formulas.
To your information a few words to the problem of simple formulas to the hand
For monoband designs the reflector is mostly 3-4% longer than the radiator. In multiband designs the reflector is only about 2 % longer. For the SWR the radiator length is most important. For the gain the reflector length has the most impact. The insulator space is also important for the SWR. The difference between reflector and radiator length influences the bandwith (SWR) of the resonance. But if you change one component it has influence on all other values. And also the wire diameter and/or material influences everything again.
So it is not easy to find the optimum. But an indication may be that an ideal SWR means not the best gain. The gain drops down about 2 db over an normal band like e.g. 20m which is more than a usual 2 element has. It is best on the beginning (CW edge) and has 2 db less on the other end. Traffie offers other wire lengths for SSB-only operators.
In the file section (file/dl7io/) you will find a zip-file with a
summary of eznec files for monoband versions from 10-80m and a excel-file with the calculations for XYZ-coordinates. Here you can change all relevant parameters like lengths for elements or insulators.
There is also a table with recommended data. While playing around with it you will find out that the relations between the lengths are different for the bands and not easy to bring on a simple formula. I have not build monoband beams for 30-80 yet but the values are plausible.

Hello Ed,W0SD,
Monoband wire use with multiband hardware:
It is possible and not to difficult with a single band. The easiest band should be 20 m. Remove all other wires and use only the original 20m wires. Measure the frequency with the best SWR with a MFJ259 or something familiar (pay Attention that the coax line is not resonant!). Now calculate the new length for the radiator and make the reflector about 3,5-4 % longer. There may be a final adjustment necessary. Changing of the insulators is not needed. You can do so for every single band if you like. But I cannot understand why to do so. If you have done the mechanical preparations of the antenna, than it takes you 10-15 more minutes to install all the wires. The time you need to determine & build the new wires for 20 m only will be

minimum 2-3 hours.

Hello Tony, VK2IC,
PVC pipes for spreaders:
I don't exactly know what kind of pipes you mean. But I would like to
let you know that it is important that the spreaders are not to soft.
The spreaders must give the pressure on the wire to hold the wire in position. This is especially important for multiband versions because the wires for the higher bands are very close together and if the wires have to much room to move you will be not satisfied with the performance. In the extreme case 10 & 12 m wires can get together
Check out if the pipes are strong enough. And if they are strong enough they should not be to heavy!
If you will build it for fixed installation and not for travelling around you can do it with fiberglas fishing pipes (with no rings, the cheapest kind of 8-9 US$ each) of about 4m length. Remove the smallest element and you have a spreader up to 20m versions. But you must support the bottom side where the spreader is fixed to the mounting plate. I used wooden sticks of 1 feet or 30 cm length inside the fiberglas pipe. Be careful while attaching the clamps. But for portable use I cannot recommend it because the clamps are damaging the surface and the thin fiberglas will break. To pack the antenna you have to remove the clamps totally and that is the problem. But I had 2 x 5 band beams made of fishing pipes down in Malta (9H3O 2001 & 9H3M 2002) and they withstand force 12 winds without any problems.
Today I use custom made fiberglas spreaders and this is the most expensive part of the antenna.

Regards Holger, DL7IO

Holger,

It is my understanding that Mike only builds them (production) optimized for CW. However, this is not a big promblem IMO since hardly any DXing going on much above 14.260, 21.350, and 28.550. The performance loss is not significant I suggest and from my exoerience.

If the antenna is optimized for SSB, the PSK and CW portions of the band, on say 20 m, will suffer noticable increase in SWR, and decrease in gain and F/B. If the owner never plans to use those portions of the bands, well okay; however, if the CW or PSK bug bites, then doom on the selection of SSB optimization. :-)

Therefore, I think Mike's decision was a reasonable one.

Hi HexBeam afficianados:

I read the review of the 6 meter hexbeam in CQ and immediately became hot to build one for 20 meters! I did a web search and found the Hexbeam company site and also the EI7BA site, which led me here. I've been hamming for 20 years and homebrewing unusual antennas is the thing I enjoy most about amateur radio. Several years ago I built a 20 meter discone in the backyard, which stayed up for about 3 years, till the wind got it one spring. :)

I'll try to look at the files so I don't ask too many newby questions, but I wanted to let everyone know I was here.

Barry,
I think somebody wrote about a discussion with Mike and he offered
him wires optimized for SSB. It was the wish of the customer (not
Mike's) and if this is a good decision I don't like to comment (PSK,
RTTY etc.). I'm sure Mike showed him the consequences.

But what happens? For the first 100 kHz down the gain will increase
up to 6.5 dBi max. (free space, no losses). The SWR will also
increase to values around 1:10 very fast. The F/B is decreasing and
than the direction switches and the former reflector works as a
director.

Ken,
it is optimized for use in the whole band, what means the CW-portion
has the best gain.

Holger,

Yes, Mike will custom tune the antenna, but otherwise it covers the band okay. I frankly am clueless what you are talking about when you state the reflector switches roles and becoming a director. This simply doesn't happen in the Hex-Beam built by Traffie in any of the five intended bands. In addition, too much concern is made over SWR. Concern over having the SWR be 1.1:1 vs. 1.5:1 simply is wasted effort. The loss is just a few percent. If you are conjugate matching, it is even less. It is interesting to observe the various SWR plots people have shown and compare then to "theory." The influence of the surroundings and installtion (such as RF choke or not) is evident in most.

I do note that on 20 m, for example, my HB SWR is about 1.6:1 at 14.0 and climbs rapidly as you mention as the frequency is lowered. From memory, I believe it was about 6:1 at 13.9. As the frequency increased, the SWR radidly dropped and then began to increase about 14.2+ and then rose rapidly again above 14.4+.

1300. Re: [hex-beam] Re: Optimized for CW or SSB?

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-01-20 15:46:13 UTC
From: Eric Carling
Topic: 1290 Message: 1300

This is absolutely not what happens (with my hexbeam)

For 20m as an example: SWR @ 14.300 = 1.6:1 > 14.200 = 1.4:1 > 14.100 = 1
1:1 >14.000 = 1.2:1 > 13.900 = 4:1

Nowhere in this curve, or even well above or below where SWR is 10:1 or
worse, does the beam lose its directivity. I just tested it on some BC
stations. F/B was still quite noticeable.

In writing this it did occur to me that I was only considering receive and
had not proved that its the same on transmit. So I did a test on transmit
with a station on 40m. SWR is about 7:1 and with or without tuner (I can
output abt 25 watts at 7:1 SWR from the FT1000MP) my test partner reported
some directivity in the normal direction.

Super High Incidence of Twaddle could be an explanation for your findings.

Eric G0CGL.

Good as it may be, I think a conventional 2 element yagi is ewasier to build for VHF/UHF bands and the Hex is probably out performed by a ZL special or HB9CV.

Holger,

You might rerun the analysis at a useful elevation angle (not 0 degs) and other than free space. I have not observed in practice any flipping of the role of the passive element from reflector to director (even out of the band using SW stations as "beacons").

This is true for the "extra bands" of 6, 30, 40 , and 75 m as well.

Barry,
there is another file gain-direction-swr.zip in the file section.
Same reaction in real space. And I don't know why the modeling
software which is working for all other kinds of antennas should be
wrong here. The F/B is very small, less than 2 dB and I think this is
nearly impossible to measure under band conditions. Nevertheless to
me it sounds very logical that the reflector is more working like a
director for lower frequencies and for a 2 element it means the beam
direction is changing.

Holger,

I have measured typically 1.5 to 2 S-units F/B on 30 m for example. Even SW stations below 14 MHz don't flip F to B when I have listened, and the F/B was certainly more than 2 dB. This is all fun to chat about, but I think I'm missing your point. What does this have to do with the hex-beam used in it designed bands?

Barry,
of course there is no point. I only explained how the antenna is
working and found of course other opinions/impressions (that is
good!). That's why I showed the source of my knowledge and how I came
to this. For me it is important to know how something works and not
only that it works. But I will try to not disturb the real important
reports and promise to be silent.

1310. Hexbeam to Hexbeam QSO

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-01-26 19:06:19 UTC
From: k1epj <n1ix@att.net>
Topic: 1310 Message: 1310

I had my first Hexbeam to Hexbeam QSO this morning with HB9ACD on 18Mhz CW. Hans was the strongest signal on the band. His HB5 was doing a great job. Signal in New Hampshire was 579 - 599 with QSB.

Dave N1IX

1311. Hexbeam to Hexbeam Qso

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-01-26 17:17:03 UTC
From: n1ix@att.net
Topic: 1311 Message: 1311

I had my first Hexbeam to Hexbeam QSO with HB9ACD this morning.
Hans' Hexbeam was doing a very nice job. His signal was 579 up to 599 at times in QSB on 18Mhz.

1312. antenna design

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-01-26 22:11:53 UTC
From: Graham Henley <zl1gdh@yahoo.com>
Topic: 1312 Message: 1312

Hi guys....

What are the design or engineering concepts behind the "upside down umbrella"?

I am considering experimenting with a conventional aligned umbrella for my spreaders. Let gravity assist in maintaining a parrabolic curve i.e. the tips will droop downwards. Other than a loss of a couple of feet in element height I can't see any problems...and an advantage I expect from this configuration is my somewhat whippy spreaders won't want to twist into S shapes etc...Anyone care to comment?

Cheers de Graham ZL1GDH

1313. Construction details

Topic: 1313 Message: 1313

Although I note that details are available in a powerpoint file, I do not own this software.
Can someone in this group e-mail me with typical dimensions for driven elements and reflectors lengths for a five band 10 - 20 m version. I am especially interested in the tip-to-tip spacing, and whether this has been found to be critical in terms of forward gain or F-to-B ratio.
I have built a five band version, using hardwood spreaders, and used an MFJ 259 analyser for tuning. It works well, but I am planning to build another one, lighter weight if possible, and with improved performance too.
I appreciate any specifics (dimensions) that can be offered.
Doug, VE3CWO e-mail ve3cwo@...

ZL1GDH Graham

"Let gravity assist in maintaining a parrabolic
curve i.e. the tips will droop downwards"

Parabolic curve? As I understand it Graham, the bow in the spreaders simply allows the spreaders to exert a constant tension on the element wire thereby keeping them taut and properly aligned. It could not possible matter (I wouldn't think) whether they bend upwards or downwards from an antenna performance point of veiw, however if they bend upward then gravity will assist (though only slightly) in tensioning the wires.

If you are really ingenious and stealth is a concern then you could orient them downward and cover the struture with plastic, creating a large umbrella. Place a picnic table under the umbrella and you should be able to convince your neighbors that you have simply created a shelter for your personal outdoors enjoyment. You may have to devise some creative explaination as to why the umbrella is located 40 feet up in the air though. 8>)

My thanks go out to Donlin and Holger for some really helpful responses to my questions. It is really appreciated that there are amateurs out there that are so willing to be of assitance to someone they don't know.

I was pointed to some Excel (TM) files, and was directed to a new web site that Holger is setting up, and was able to confirm that I am on the right wavelength (no pun intended) with the construction of my five band hex-supported antenna system. I have a nice start on the second one already. Now that I have a digital camera, I will make an effort to post some photos, in due course, of the work that I will be doing.

If there is anyone else out there that has some emperical information relative to the tip-to-tip spacing of the elements, I would be pleased to hear from you.

Regards, Doug, VE3CWO

Traffie will be at the Orlando Hamfest (WX in the NE permitting!).

He will have a booth and I understand that a shootout with an A3SS is planned. Not sure about the details yet, but gather that it will be handled by the club station committee there.

If you attend, drop by and see Mike. Am sure he will be happy to discuss the Hex-Beam, model airplanes, cars, woodworking, etc.

73,
Barry - W4WB

1319. Newbie construction comments

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-02-10 16:16:35 UTC
From: ab0si <ab0si@yahoo.com>
Topic: 1319 Message: 1319

This is intended for fellow new hams who are thinking of going with a hexbeam.

Customer support:
Simply the best. If you want a negative, it is lack of email support. However, just give them a call. No matter how simple or strange the question, you will find them remarkably helpful and supportive.

Construction:
I am still in awe of how easy it is (I bought the 5-bander). It is VERY difficult to do anything wrong. The instructions are quite clear with good illustrations. For a newbie such as me who has the mechanical aptitude of an acorn squash (and experience to match), this was a nice change from other antennas I have installed (Butternut's unreadable diagrams and unlabeled components and Force 12s assumption that the builder (moi) is an experienced antenna maven.

I live in lovely warm Minnesota (wind chill today is -30 something). I was able to assemble the hexbeam in my double garage and stay out of the weather until it was time to install the beast on the tower.

It is much easier to put the thing together with two people. Much easier. Neither one is required to have much skill, but a third hand makes things go very fast.

The very nature of the design means that tuning would seldom be required. For anyone who has had the enjoyment of tuning a multi-band antenna, this is a Good Thing. (GT is a technical term: the opposite of GAG)

Performance:
It is a compromise antenna, guys. It is not a full size 9 zillion element single band yagi. It is, however, a remarkably effective small, light weight antenna. There are even an advantage in this (the silver lining): since the 1/2 power beam width is quite wide, you don't have turn it all that often or point it exactly in the correct direction. Of course this means that the highest gain is less (that's the cloud).

Paul ab0si

1320. RECENT PERFORMANCE

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-02-11 16:43:47 UTC
From: Andrea & Chuck Bridges
Topic: 1320 Message: 1320

I was just reading the comments from "newbie" Paul, AB0SI.

The comments match my experiences with the antenna. I even appreciate the "silver lining." I played in last weekend's CQ WPX RTTY contest. I live in California, and late in the afternoon I would point the antenna (the five-bander) at Japan. While "running" JAs (well at least in my small way) on 10 meters, I was able to work some Latin American and a lot of US stations without moving the antenna.

The antenna is clearly a compromise, but one that fits with my operating style and requirements.

Paul, thanks for your comments.

Chuck, AK6DV

1321. maintenance

I will be doing spring maintenance on my HX-5Bi hex beam in the near future. What are some of the goup members experiences with annual maintenace on the hex-beam? Did things hold up well?

Has anyone opted to put the extra bolt through the mounting plate to add to the sturdiness rather than using the set screw only? (I have only the set screw.)

Anyone have problems with the pins coming out of the telescoping mast? (I have the new pins, but have not installed them yet).

Overall, performance wise, I have had great results with the antenna when it comes to DX!

Topic: 1321 Message: 1322

"Annual maintainance" is a good question and I'd be interested in others comments also. I used coax-seal where the pl-259 goes into the center support and also where the driven & reflector elements connect to the nuts on the center support.
One of the pins on my mast was beginning to work it's way out and I've replaced them with the new pins. It's good to put those new pins in :-)

Good questions! Prompted to have a proper look, I have found nothing needing attention.

I did not put in the extra bolt - I didn't have the means to drill it and it was a concern at the time. However despite constant high winds this winter, including two 90mph storms, no weakness has shown up through a lack of it and neither has the assembly turned on the mast.

Like you Todd, my results have been thrilling. My ACOM 1000 amp is not too happy with me though as its suffering from neglect.

Eric.

1325. HX-5B SWR on 12 meters

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-02-13 16:24:42 UTC
From: Floyd Sense
Topic: 1325 Message: 1325

Hi All. It's been just about 3 years now since I erected HX-5B #18 and just ran into a problem and wanted to find out what others see on their beams. Unfortunately, I can't locate the SWR plots I did on my antenna when I first put it up, so don't know what the SWR on 12 meters was at that point. Recently, I acquired a different linear amp and this one has a grid protection circuit that kicks out if the SWR is very high. The first time I tuned it up on 12M I found the grid overload protection was kicking out early and so checked out the SWR situation. I used my MFJ-259B connected to the feedline and scanned all the bands to see how the SWR varied across the bands, and also checked to see where the lowest SWR was on each band. The following is what I found. Has anyone else looked at this and if so how do your results compare? What are folks seeing for SWR on 12M?

In the following, each line represents the results for one band, and the SWR numbers shown are: low band edge, high band edge, lowest SWR in or near the band.

20 Mtrs: 1.7, 1.2, (1:1 at 14.400)
17 Mtrs: 1.2, 1.2, (1.1 at 18.106)
15 Mtrs: 1.2, 1.2, (1:1 at 21.124 and 21.220)
12 Mtrs: 2.0, 1.6, (1:1 at 25.232)
10 Mtrs: 1.4, 1.2, (1:1 at 28.314) For this band, the top edge number is for 28.650 instead of 29.7

Note the odd frequency of 25.232 for the lowest SWR in or around 12 meters. The antenna is mounted with the top element at 40', with no other wires within 40 feet. There's no variation of the 12 meter SWR when rotating the beam through 360 degrees.

Topic: 1325 Message: 1326

My HX5-Bi has been up for almost 2 years. I've noticed the SWR on 12m appears relatively high as compared to other bands. On 12m it's about 1.7:1 while on the others anywhere from 1:1 to 1.4:1. On several occassions the autotuners in my rigs have kicked in while on 12m. For most part, I just figured that is the way it is and wasn't terribly concerned. However, on two occassions the SWR on 17m and 12m went through the roof, but not on the other bands...hence, did not appear to be feedline or connector issue. The SWR then settled down to its "normal" readings for 17 and 12. Not sure what the issues where but all seemed to have been fine for past few weeks (knock on wood). Still a great antenna. 1327. Re: HX-5B SWR on 12 meters

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-02-14 04:10:45 UTC
From: w6hb <w6hb@arrl.net>
Topic: 1325 Message: 1327

I just spot checked my HX-5Bi, S/N 173, again on 12 and 17 meters. I do not have the 259 at this time. Using the VSWR meter internal to the FT-1000MP with no tuner, I measured the following: 24.892 1.2:1.0 24.988 1.0:1.0 18.070 1.2:1.0 18.166 1.0:1.0 This is with a full 100 watts output and no evidence of foldback. I question if the variations reported are due to condensation in the feed tube and or a plugged drain hole in the mounting plate. The older feed tubes did not have the internal feeders Teflon wrapped. I believe these were problematic on some frequencies with high power. 73 - Doug - W6HB --- In hex-beam@yahoogroups.com, Harry Tankin wrote: > My HX5-Bi has been up for almost 2 years. 1328. SWR AND MAINTENANCE

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-02-14 16:45:25 UTC
From: Andrea & Chuck Bridges
Topic: 1328 Message: 1328

I am very curious about maintenance, so please keep the postings coming!

Here's a SWR plot for my HX-5Bi done in December. I used an Autek meter at my rig.

3500 6.60
3750 4.80
4000 6.30

7000 5.90
7150 7.40
7300 8.40

10100 5.10
10150 4.80

14000 1.58
14150 1.11
14350 1.12

18068 1.42
18110 1.21
18168 1.10

21000 1.27
21200 1.19
21450 1.08

1330. Traffie's Comments on Care of Your Hex-Beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-02-18 16:33:10 UTC
From: w4wb <w4wb@arrl.net>
Topic: 1330 Message: 1330

In response to the question of what annual care should be given to the Hex-Beam, Mike Traffie said basically nothing is needed.

However, there are a few points he did suggest.

1. Be sure the drain hole on the center post is clear and free to allow water to drain out.

2. If you don't have the base plate bolted to the mast, then you should do so the next time you have the antenna down.

3. Check the cap on top of the center post to be sure it is sound.

Regarding the question of 12 m SWR being too high for some folks at times, this is likely caused by mosture. The 12 m section is rather "hi-Q" and can shift due to water or ice. I have never had a problem with mine even in heavy rains FWIW.

Mike commented that they have had Hex-Beams up for years with nothing done to them and they continue to perform FB.

73,
Barry - W4WB

From: David Douglass
Topic: 1333 Message: 1333

Doug,

Thanks for the link and very interesting!!

G6XN covers this type of antenna in some detail in his book "HF Antennas for All Locations", and he gives them pretty favourable press.

I suppose the downside to these is the need for a 5 metre spreader (plus a little more for bowing), as opposed to not much more than 3 metres for the Hex. Still food for thought though!!

Regards

David, VK2DPD

Hey folks, it is rather quiet on the list. Even though the bands have not been very good lately, I have found the Hex-Beam to contiue to perform well. This afternoon, I worked a VK2 on 12 m (propagation prediction program indicated a no-way contact). He was running a 5-element Yagi and 400 W. He was about 53 and my report was 57. We had a great chat. After we signed, he was trying to copy a number of other stations calling him, but they were all in the noise. The two stations he worked before me got 53 to 52 reports as I recall. Also worked, the other day, 5X1DC and SO7V on first and 2nd calls.

We have had several strong storms recently and the HB weathered them well.

Hope your Hex-Beams are doing well for you too.

Traffie told me that he is planning to be at Dayton. I don't know if he plans to set up a demo site. As I recall, the Hamvention group has a 5-band Hex-Beam. Perhaps they will have it up and working.

Topic: 1339 Message: 1339

Well since Barry says the List is quiet.....I am considering putting up the 40M Hex Beam. I talked to Mike about it and its sounds very interesting. For all the reasons we have been using the 5 bander the 40M offers the same physical attractions for reasonable performance on 40M where I would be unable to put up a conventional 40M Yagi or Quad. With the higher bands quieting down, sounds like spending more time on the lower bands is the future for us. Anyone out there able to give some first hand experience?

1340. The Hexbeam and ice

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-02-25 17:51:16 UTC
From: Floyd Sense
Topic: 1340 Message: 1340

My HX-5B hexbeam survived the ice storm of a week ago with no damage, but was unusable for a couple of days. The antenna had a 3/8" coating of ice over everything and the SWR on every band was too high for operation (20 meters was 3:1 across the band). A friend of mine with a 4 element quad experienced the same problem with his antenna, but noted no problems with yagis with a similar ice coating. A few days after the ice storm, we had sustained winds of 35 mph, with frequent gusting to 48 mph, and the hexbeam survived quite well. I'm just glad that the wind didn't come at the same time as the ice! Yesterday I noticed that one of the larger local yagi installations had been stripped of a couple of elements by the ice and wind. I wonder if any of the group members have had damage to their hexbeams by this year's weather, and exactly which parts of the antenna failed?

Hey Barry,

I'm glad I stumbled onto this list. I have enjoyed reading about other's experiences with the Hex-Beam.

I'm new to this group and though I've been a licensed ham since 1976, I've been completely inactive for the last 10+ years. I just got back on the air in the last couple of weeks and at the current time, I'm running mostly qrp on the CW HF bands, unless I decide to really saturate the ether with RF; in which case, I pump a whopping 20 WATTS through a tuner and into a G5RV configured as a dipole and suspended at about 30 feet. But enough about my BIG GUN station setup...

I am curious as to what power you were running when you latched on to that VK2 on 12 meters yesterday and how high is your Hex-Beam? ...and any other information along these lines that you think might be relevant.

I haven't exactly committed to a Hex-Beam purchase yet, but I'm sure THINKING HARD about it. If I do, it will probably be mounted on a mast of some kind unless I find a deal (highly doubtful) on a light duty tower around here. I'd prefer not to have to run a bunch of guy wires, but if I go the mast route, I have little choice.

TIA

James

I you do go the Hex-Beam route, I'm sure you will find it a blast. I
received a message from Ed (ex P5/4L4FN) that received a Hex-Beam
from some of us last year. In this message he said "... have
to "admit", it gave me big advantage comparing with vertical and its
also true - I made most of my qso's on it and much more easier."
The "it" is the Hex-Beam. Ed is a fine gentleman that we will enjoy
working from his next QTH.

Hello friends,

I have home made 5 band Hex-beam since Nov 2002. You could see some pictures in photo section. RIG
is FT890AT + home made linear on GU74b tube. I have few thousends QSO with this antenna, most of
them in contests. The last one was WPX RTTY where I finnished with 1100 QSOs. We had a lot of wet
snow just before the contest. It start to freeze during the night and hex-beam was coated with abt
2cm of that. I tried to turn the beam left-right to broke the ice without success. SWR was little
bit higher than normal, but performance was OK. Early morning on next day start snow storm. I get
out to look at the beam. Part of the ice was broken, but there were no damages. Wlado,LZ2PL come
at home later. He have 13el LPDA 14-30MHz and he wants to compare it to my beam. The conclusion
was that both antennas are almost equal, but as size... His LPDA have 8.8m boom, longest element
is 11m and weight abt 50kg.
We are planning to make a 40m monobander this summer.

Hi Doug,

Yea, we need to do a sched soon. My Hexbeam has been performing flawlessly. I have been able to work many new countries (since the hexbeam, 89 to now 126). I am going to make it to the Hamvention in Dayton this year. I want to meet Mike and tell him how great his product is (and get a T-Shirt saying, "I have been Hexed!!" hihi).

The power line noise is still here, except for when it rains. But I will be getting an Power Line noise tracker from MFJ (MFJ 852) and use that to track things down. From what I understand, there is some loose hardware on a pole to my north. No worries... I will find it.

BTW... I have been comparing my Hexbeam to a Force 12 C3SS from a ham down the street and it seems they both do quite well. He has an advantage though to the north because he does not have the power line noise like I do. In fact, a JA sounded a little louder on the dipole only because the power line noise is at a minimum. The signal got louder on the Hexbeam, but so did the line noise. I am patient.

Hello from beautiful Southern California!

My HB (#188) is mounted on a Glenn-Martin tower (4.5 feet tall...the shortest they make?) and then on the roof of my 2-story house. Thus, it is about 30-35 AGL. Works great! No need for a tuner (SWR less than 1.6 every frequency I want to work) and no guy wires. I'm using a Yaesu rotator but even a simple TV one will be OK (I have been told..but no experience).

SO...go buy the Glenn-Martin tower and the HB, then enjoy!

Guys,

I wish to share my impressions regardind doing bussiness
with Ken Mirabella.

I decided to connectorize my power cords with Powerpoles. I
have a dealer in S?o Paulo, Brazil that carries the PP45
line. They are charging US$3.6 each pair. Molex type
connectors are about 50 cents. They can send me the
connector the same day.

But, as I am also considering buying a Rigrunner, I checked
Powerwerx for prices.
The price range is good, but there was no way I could send
it to myself... Brazil wasn't on the country list.

An email sent to Ken, and he promptly added my country! The
shipping options didn't allow for (very) small orders, like
mine...Just 25 PP45 pairs. Another email and Ken promptly
added another shipping option!

This guy is awesome!

While I was writing this, Ken wrote me again. There is
nothing I can say to express how he care about his
customers... I haven't even placed the order!!
That is Customer Relation Management!!!

NOTE: I am in no way affiliated with Ken, Powerwerx or any
other company implicitly or explicitly mentioned on the
message.

Hello friends,

Here is the same situation like Herb describes. My Hex is mounted on top of a telescopic aluminium
mast, at 1.5m above the roof of my 2-story house without guy wires. I'm using Conrad TV rotator.
All cables are passing through a non-used chimney from the roof to the basement where is my shack.

Since I put this Hex up it became the main attraction in the area. Everybody who walk around stops
for a while and have a look on the beam. My neighbours like it very much and I heard lot of rumors
starting from a sattelite dish till a place to dry cloths..hi..hi.. Even my XYL said that she
prefere this HEX instead of 13el Logperiodic on the roof of LZ2PL! She dont like my 160-30m Vertical in the middle of the garden but this is another story.

1352. New hex project - Spreader question

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-02-28 13:14:25 UTC
From: Paulo Marcondes
Topic: 1352 Message: 1352

Hi guys!

THere is another hex project just starting.

After reading the list for 3 months now, I decided that I would build a hex-beam.
I've bought the rig in december, after being a ham for 6 years (not much time on air, though)

Well, the question is about spreader materials...

I believe PVC is not an option here. I've heard that it is too fragile and degrades when exposed to UV radiation. I live in SE Brazil, so we have lots of sunny days.

Fiberglass is the preferred material, isn't it? If so, How did you build the spreaders?
a) Solid long rod? Wich diameter?
b) Telescoping? How? Specs, please...
c) Solid tapered rods? (Not an option for me...I would have to do some machining and I don't own a lathe...)

Did you use any kind of finish (varnish, paint)?

I've found a manufacturer of FG that carries a line of solid rods and tubes in lenghts of 3 and 6 m. Cost of 1" rods is about USD 4/m. Don't have other prices.

Bamboo is my preferred option, since I believe it is much cheaper than FG.
I think I can have it at NO COST. Bud, VE7ASH reports using 1/2" OD dry (yellow) bamboo.
I can take it green, let it dry naturally (might take a week or two). Then I can treat it like wooden fence posts, coat with some varnish or acrilic paint.
I'd like to hear from those who have tried bamboo spreaders.

Hi Paulo!

I built up a 5 band version 3 months ago. I'm using fishing rods. I bought six 4m long telescopic
rods and removed the last section (smallest diameter). I used fast acting glue on joints of tubes
otherwise they could slide.
If you go to this option be carefull when you tighten the clamps. The wall of fishing rods is
about 0.5mm only.

Hello jason.

I emailed you a couple of weeks ago about the Glenn Martin Tower and Hexbeam.

I have another question, I noticed that you installed the tower first. How heavy and how difficult was lifting the antenna and placing it on the mast?

Was that better then installing the antenna and trying to lift the tower and antenna in one shot.

Let me know the weights involved, I am planning this project ASAP.

Thanks and 73's

Hi John,

Welcome to the group! I think you will love that configuration. I am having a blast!! Worked Thailand for the first time ever recently and I can get into Asia now. Never really could do that before. The Hexbeam has probably been my best investment yet in this hobby (including the support structure... my house and the tower!! heheh)

Let us know if you have questions, concerns and we will answer them as best we can..

Again, welcome!

I am new to ham radio, not that new but new.

I am going to purchase a Hex-Beam Multi band antenna. And also a
Glenn Martin Roof mount Tower. I was not aware of this group until I
talked to my neighbor WB3FSR Peter, that I found this group.

Hi John,

Yes, I remember your email. (I am including this email to the group in case there are other interested parties...)

I installed the tower first because having the Hexbeam up there would just make it too cumbersome to move the tower around. Plus, that is wind load up there. It may not be much, but it may be enough to topple it if it is only a couple of guys up there. I used some rope to hoist the antenna up to close to the top. The XYL operated the rope. Once it was at the top, I used one arm to put it on top of the mast. No big deal. Follow all safetly considerations first!! HIHI.

For me, I say put the tower up first. You can always make your own gin pole with a 2 by 4, some clamps, a pulley, and rope. It does not need to be all that elaborate because the Hexbeam is so light.

Keep us posted on your progress!! And let us know if you need any advise. BTW... have you decided on the Hexbeam? You will LOVE IT! Let me know if you want to do a sched.

John:

Mount the tower securely on your roof, then decide how to assemble the HB. Since my G-M tower was so short, I was able to put the mast in the tower, then proceed to assemble the tower (base plate onto mast, 6 spreaders onto baseplate, etc). You will need some help (a bit) attaching the wires to the insulators/connectors on the spreaders...two hands to hold the wire in place and one to tighten the screw.

Enjoy!

Hey John (KC2JJD)
The beam is light in weight and not hard to put in place. I have mine on a Radio Shack tripod and it works fine at 20 ft. Since Wednesday I have been working on getting the antenna higher. I will be putting it on a 38 Ft. telescoping mast and with the rotor and antenna mast, the hex-beam will be up around 41 ft. I spent a couple of hours on Thursday measuring and cutting my guide wires. I am guiding it in three places, at the rotor and at the next two sections. Today I placed all my anchors in place and hopefully on Saturday I will have the antenna in place. I am looking forward to the height since I have never had an antenna up this high before, hoping it will make a difference. I think we spoke before on the phone about the hex-beam. Good luck with yours, it is an easy antenna to work with and the 5-band is light.

You could have knocked me over with a feather when I read the post from Frank, KB2KBC. This is exactly what I have planned. In fact, I live in Freehold, NJ, which is a short hop from Bordentown. Must be a regional influence ;-)

Frank, please post all your experiences, as I'll be following suit in the spring. I'm not as hardy as you, and will wait for the snow to melt before going out to do antenna work.

I did come up with a rather simple mast support for my inverted vee that I plan to use for the telescoping mast as well. If anyone's interested, I can post photos and a description.

Hi Barry and all

yes I have a few question to ask him, if is possible I'll appreciate if you could send a fax with my question and turn me by email the answer. anyway I can also ask here maybe somebody could answer.

1) I have a telescopic tube 29,5 feet long, do I need to change it and get a tower or I can use it?

2) I live in Rome center, so i need a not high impact antenna otherwise my neighbors could make my problem

3) Does anyone knows about TVI problem? I have the TV antenna not far more than 6/7 feet by the tube in which is my antenna, actually I have a monobande 4 elem. yagi for 10 meters and V inverted dipole for 40/80 and with 500 Watts no problem.

4) Do you know how is wide on the top?

Thanks

From: David P Douglass
Topic: 1362 Message: 1362

Hi All,

Just a quick note for the few members we have in the less crowded hemisphere!!

I've finally come across a company in Australia that supply quad spreaders (aka Hex Spreaders) in 2.9 and 3.9 metre lengths.

From memory the address is www.kvkantennas.com.au

They are not the cheapest but, also not the most expensive I've seen and come supplied in army green for extra stealth!!

This company seem to be getting into the wire antenna market and the site is worth a browse.

Regards All

David, VK2DPD

> 1) I have a telescopic tube 29,5 feet long, do I need to change it and get
> a tower or I can use it?

*** First, I am assuming you are thinking about a 5-band version. Mike sells a 30' mast to mount the Hex-Beam upon so you should be fine. Depending upon what your specific location is with respect to building, type of material, etc., it is reasonable to expect the antenna will perform fine. If you mount your rotor at the top with a short mast above it, the 20-m antenna will be about 34-35', which is okay. Just remember to guy the mast well at three heights including at the rotor area. The Hex-Beam weighs about 9 kg and has relatively low wind loading and almost no induced torque.
>
> 2) I live in Rome center, so i need a not high impact antenna otherwise my
> neighbors could make my problem

*** The Hex-Beam is resonably neighbor friendly. It doesn't look like an antenna people has seen before. The arms are white, but some folks have painted them to blend into the surroundings with great effect.
>
> 3) Does anyone knows about TVI problem? I have the TV antenna not far more
> than 6/7 feet by the tube in which is my antenna, actually I have a

> with 500 Watts no problem.

*** If you have no problem with it now given your present setup, you
should be fine. Of course, there is a question about the other HF
bands. You should also use an RF choke on the feedline just below
the antenna's base plate. It is made of about 5-6 Type 77 or 73
ferrite beads that just go around the coax. This choke effectively
eliminates feedline radiation (outside of the coax shield).
>
> 4) Do you know how is wide on the top?

*** The turning radius is just under 3.0 meters. This is for the 10-
20 m version.

1364. Re: [hex-beam] Re: new member

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-03-02 15:16:13 UTC
From: Harry
Topic: 1358 Message: 1364

I've had my HX5Bi up for about 2yrs now. Mounted on the Traffie 30 foot push up mast. Mast is guyed at top and bottom. Rotator is at bottom of mast about two feet off the ground. Rotator turns mast and antenna with no problem. Originally I used a Yaesu G450 rotator. While "adequate" as the mast and antenna weigh only about 40 lbs, I elected to go with a Yaesu G1000DXA --overkill I know by figured I would err on side of snow and ice loading. The arrangement works quite well.

I installed a 5 foot section of conduit pipe (3 feet in ground) with about 200 lbs of Quickcrete to support rotator, mast, antenna.

Initial antenna installation and raising of mast is definitely a two person, if not three, job. Once done, one person can raise and lower mast/antenna combination easily on a not so windy day. A very tall step ladder will allow you to work on parts of the antenna without removing it from mast.

Any locals interested in seeing how I did this welcome to visit qth in Yardley, PA.

1) I have a telescopic tube 29,5 feet long, do I need to change it and get a tower or I can use it?

2) I live in Rome center, so i need a not high impact antenna otherwise my neighbors could make my problem

3) Does anyone knows about TVI problem? I have the TV antenna not far more than 6/7 feet by the tube in which is my antenna, actually I have a monobande 4 elem. yagi for 10 meters and V inverted dipole for 40/80 and with 500 Watts no problem.

4) Do you know how is wide on the top?

Thanks

DOn't know of any direct comparisions, but the HX-5B works very
well. The one person I know that has the StepIR is very pleased with
it too. Big difference is the raw size, with the HB being a lot
smaller and more neighbor friendly. Performance he said is FB.
Can't go wrong with either. Some folks are concerned about the
mechanism holdong up in the StepIR, but I am not after seeing it and
talking with them las year at Dayton.

Topic: 1342 Message: 1368

Well, all,
I am back from skiing in Vermont for a week, I left the day after the antenna went up higher. I used the hex-beam on Saturday night and Sunday morning before I left. I want to say that it is about 30+ feet up now and boy what a difference 15 Ft made in reception. The signals are stronger and I hear the New England area down to Virginia (I am a county hunter) much better.
Now for the details on the raising of the Hex-beam. Well, it was a one man job and it got a bit scary at times. As the antenna went higher, it began leaning to one side like a wilted plant. I could not reach the desired 40 feet because the weight became a factor. After locking in, I quickly adjusted my guides and straightened the antenna. I will make more adjustments in the spring and use some additional manpower.

Hi Dale,

I believe you would find that the interaction between the spreader and the elements would severely degrade the performance and tuning of the antenna. The use of wire guys on the mast should also be avoided. I also note that there is remarkable interaction between the several elements comprising the 5-band Hex-Beam.

Hope the above was helpful.

Hi Tom,

In addition to the RF choke on the feedline, you might check to be
sure you have a good RF ground too.

1376. Re: 40M Model?

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-03-09 14:18:47 UTC
From: n1eu
Topic: 1371 Message: 1376

Thanks Holger! I used your dimensions and modeled it with MMANA. In freespace, MMANA shows max f/b of 16dB at 7.050Mhz and f/b of 6dB at 7.0Mhz and 7.2Mhz. The gain is 6.75dBi at 7.0Mhz and falls to 3.77dBi at 7.2Mhz. MMANA shows 2dBi gain for a dipole for comparison. The 50-ohm SWR is 6.5 at 7.0Mhz, 2.3 at 7.05Mhz, and 1.5 or below 7.1-7.2Mhz.

I need to get the SWR lower 7.0-7.05Mhz while keeping the gain high. I'm a cw op and use a Beverage for receiving so don't care about the f/b figure.

Thanks & 73,
Barry N1EU

Barry N1EU.

I was able to easily get an swr under 1.5 to 1, in fact it was 1.2 to 1 as I recall. Mind you that was on ten meters (single band hex) however I think it should be duplicable on others bands unless adversely affected by external factors.

1379. Can wind degrade the performance of a hex-beam?

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-03-10 21:50:05 UTC
From: Paulo Marcondes
Topic: 1379 Message: 1379

In my search for suitable materials to my HB H-B (homebrew Hex-beam),
I've stumbled in an advice from a brazilian amateur...

He advised me not to use bamboo spreaders, because they flex too much in the wind and it may degrade the radiation pattern of the antenna.

Has anyone experienced such a degrading effect on the hex-beam subject to strong winds (not windstorms) ?

AFAIK, the flexing in the spreaders will not be that much, because of the equilibrium of forces in the spreader-tension wires system. Does this theory witholds in practice?
I am not a mechanics experts, but I am not a completely lay person...

> Gary as you said, you got the swr adjusted.
> Q;did you trim the wire,if so what lenth/freq did you have wire cut?

I cut the wire according to the formula, Not sure just where I got the formula but it was off this reflector. The wire required absolutly no trimming other than I might have made it slightly longer as I like to work psk and that is in the the cw portion of the band.

I fastened the wire in from the wire ends slightly so that I could have trimmed without having to refasten and in fact I could have just wrapped the wire back on itself rather than cut it if that had been necessary. There are some pictures of my "project" in the photos section. To feed it I simply connected the coax center to one side and the sheild to the other side. Too easy.(see picture 23, 24 --my photos-- you can see the excess at right angles to the elements) I doubt that I ever built an antenna before that required absolutly no adjustment as this one worked out to be. I brought the feedline up above the feedpoint then bent it down so that the feed was from above. My reason for doing this was to allow rain to drip off, rather than to easily penetrate into the coax if my seal (used silicone) was not adequate.

> Q;what swg/awg or mm thikness wire you used.

I used standard household wire number 14 solid. Stretch it a bit before using it and that hardens it and helps to prevent furthur stretching over time.

> Q;insulated or not.

I stripped the insulation off. I am told that leaving the insulation will require that the wire actually be shorter. Removing the insulation reduces weight and the wire soon tarnishes in the weather so become invisible, which also was part of my consideration.

I will be very surprised if you are not tremendously pleased with the antenna.

Check the files section too there is much information there. If I recall ve7ask has a decent write up. Ah heck so do all the others hi. 8>)

Frankly I can't see it being a big problem. I would guess it will be dependent on the thickness and rigidity of the bamboo that you use. check out the files section, ve7ask built his from bamboo.

Yes, I seriously doubt that this degradation may be
noticeable.
Maybe measurable with top notch equipment, like those used
to tune satellite antennae :)

From: shibukiau
Topic: 1383 Message: 1383

I am thinking of buying a 5 band version of the Hexbeam after seeing all off the favourable comments in this group. Question I have is --- could I mount a Diamond VHF/UHF vertical colinear ant.above the Hexbeam on the vertical member of the beam?? I have only one tower in a restricted area which means I need to use it for my VHF/UHF ant. as well!!
I would appreciate constructive comments from the group as I can't find an email address for the manufacturer to ask him this question.

Cheers!

Topic: 1383 Message: 1384

Hi. My experience is that a vertical separation between antennas is much much better than a horizontal separation. Considering that 1. the separation is vertical in this case, the vhf antenna is really out of the radiation field of the hex. 2. the antenna frequencies are quite separated (hf - vhf), I would guess that you would experience no noticible degradation of either antenna.

When experimenting with repeaters some years back (2 mtrs), we learned that using 2 antennas and having the one 20 feet above the other was better than having them the same height but 200 feet apart. Most certainly it is worth a try.

The center post of the Hex-Beam isn't designed to have anything attached to it such as your vertical. What I suggest is the you mount a non-conductive mast close to the HB base and offset enough to clear. Have it go between the driven and reflector elements on the side opposite the HB feedline keeping it close to the HB center post. Likely will work then.

Barry,
sorry for delay...
That is interesting to hear. I had not much companions in modeling
and did not build a 40 m version yet. So I could not confirm the
results by a practical test.
But there are known problems of the modeling software for
configurations with closed wires. And for our type of antenna the
wires are very close at the feeding point and at the end of the
elements and both points are critical. I don't know MMANA but will
have a look on it. May be it uses another kind of logarythm than NEC2-
or NEC4-based software.
Please put the file into the file section that I can get access to
it.
thanks Holger

Hi Barry,
I just uploaded a 40m MMANA model in LZ2BE file section. The way I
did the calculations is the same I did for 5 band version which I'm
using now. If this works for 5band version it should work for 40m too.
The settings are for 20m above real ground.

Thanks Bob - your model does yield better results at the low end of
the band.

Thanks & 73,

1392. Re: [hex-beam] China!!

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-03-13 14:26:04 UTC
From: stanghp93@aol.com
Topic: 1386 Message: 1392

Congratulations Jason (N8XE) on China. I raised my hex-beam from 18 Ft. to 33 Ft. and the JA's are 3 to 4 s-units louder. Where I was hearing them at S 2, now they are S 5 to S 6. This is much easier on the ears. Keep having fun with the hex-beam, it is the best multi-band antenna I have used.

1393. Balun location

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-03-16 23:42:41 UTC
From: Greg Fischer
Topic: 1393 Message: 1393

I am almost ready to install my completed HX5Bi. I want to install a bead balun I have laying around from the wireman. The beads are in a pvc sleeve with an SO-239 at one end and a PL-259 attached to a pigtail at the other end.

I would thing using nylon ties attaching it to the center support at the top would be best, but when review balun information on the archieve most mention to put them at the base or just below it.

Any info would be appreciated.

Tnx
Greg

1394. Bead Balun location

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-03-16 22:08:35 UTC
From: ab7r
Topic: 1394 Message: 1394

Hi all.

I am about ready to put up my tower. The HX5bi is assembled and sitting on the roof right now. I have a spare bead balun from the Wireman that is encased in pvc with an SO-239 on the bottom and a pigtail at the top with a PL-259.

My question is where is the best location for it? I was going to connect the pigtail directly to the antenna and loop it over and wire tie the pvc along the center support of the antenna right at the top.

Or, should I run about a 4 ft length of coax to the antenna and keep the balun at or just below the base of the antenna?

I would think the closer to the antenna feed point the better, but when looking through the archieves, I notice mention of placing them below the base.

Thanks
Greg

Hi Greg,

Best to keep it below the base (hub) of the antenna. Problem with having it as you are considering is that it is in the field on the antenna. You should find out it the beads are Type 43 or 73/77 material. 43 is not so good for HF and takes 10-12 to be really useful. Type 77 takes 5-6 and is much more effective.

Thanks Barry. Guess I will put in a short length of coax from the feedpoint, looped over and down the center support and put the balun just below the base plate. The PVC section of the balun is about 10 inches long and uses #73 beads. So I hope this will do an effective job. I am just not a fan of having so many connectors in line between the antenna and the rig. This will require a pl259 from the 4ft length to a barrel connector to the pl-259 of the balun and then the rest of the coax below the balun. I may just order a special one with a 4ft pigtail and connect the balun directly to the antenna. This would still have enough length to be below the antenna's base.

Thanks again.

Hi Greg,

Sounds like a plan. I wouldn't worry about loss in the connectors (about 0.05 dB as I recall) as long as you seal them with Coax Seal or the like. One thing to remember is to locate the coax proximate to the center post exactly as described in the instructions. The use of a couple of cable ties to hold the coax in place is useful.

Lets us know when you get your HB up pse.

1399. Still Smoking DX

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-03-18 23:24:02 UTC
From: w4wb
Topic: 1399 Message: 1399

Hi Folks,

Just thought I would share a QSO I had yesterday with John W5GI and Tom WA4TP on 17 m. Tom was weak since we are a bit over 100 miles apart, but John had a nice signal from Austin, TX. John's comment (before I joined in) to Tom, when Tom mentioned he was using a Hex-Beam, was that he has worked a number of guys using the Hex-Beam. Said that they all shared the same characteristic -- loud signals. He confirmed my signal being strong as well when I joined in. Nice to talk to Tom for the first time on the air too. John was using his "famous" W5GI dipole antenna.

Today, I heard 3XY1L on 20 m running a huge pile simplex! Just had to see if I could bust the pile and did on the first call. 3XY1L has good ears and seems a smooth operator although operating split would helped. Of course, his equipment may be limited.

73 es good DX,
Barry - W4WB

Topic: 1399 Message: 1400

Hi Barry,

Glad to know you still enjoy breaking into pile-ups.

I also worked 3XY1L this morning (Japan time) on 20m SSB with my Hex (short path from JA). There was no big pile-up among JAs (due to early morning or my good ear?), I called him twice and worked.

Since I put my HX-5Bi up on my condo at 30 meter high from ground level in December 2001, I have not made any maintenance but it still gets lots of DX.

I sometimes tune on HexBUS frequencies but in vain.

Looing foward to working you again soon.

Hi all

Maybe be the following could be a stupid question but for me it is a serious problem.

Should I have problem with the 5Bands version with bird? Yes friends I live in front of a big Park in Rome center and I have all the day 2/3 Birds weight around 7 lbs each one, on the antenna, for the long john 10 meters band now I have no problem, but how could be with a hex-beam loop?

Andy; Here in NY state we have a variety of large birds. A decoy Owl has proved most successful at the airport to keep these birds from nesting in and on the aircraft. Also a local ham friend of mine has a decoy Owl on top of the fence in his rear yard to successfully keep birds off of his antennas. Seems like it would be worth a try. All the best and gd health 73 Ralph WA2NTK
P.S. I have been using the 5B version of the HB for 18 months with great success.

1408. NH2PW QSOs

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-03-22 02:14:48 UTC
From: w4wb
Topic: 1408 Message: 1408

I had a pair of quick QSOs with Phil NH2PW this afternoon (2200Z) on 15 m and then 17 m. Phil is using a FT-1000MP Field and a HX-5Bi at about 30'. As you might have noticed today, the solar numbers were rather poor; I = 108, A = 12, and K = 4.

Frankly, I had little hope of working Phil since I was hearing absolutely nothing from that part of the world. A H4 was spotted on CW on 17 m, but could not hear him at all. Around 1500Z, I did work H44H who was a good 589 on 17 m. I gave Phil a call at the appointed time on 15 m and, much to my surprise, he replied! He was weak, about 53. We then QSYed to 17 m and made the second contact. He was weaker, about 42. We felt it hopeless to try 10 and 12 m this time. Will wait for better band conditions.

Phil has not had his Hex-Beam up very long --- well, up twice if you recall that rather severe storm recently! He has been operating QRP with a FT-817 and QRO with the Field. Phil is roaring towards 200 worked already. Congratulations Phil! His great QTH on Guam and being desirable DX himself helps. :-)

73,
Barry - W4WB

Hello friends,
in case we get all our luggage to Central America we will be able and willing to give you points for your HXCC. Next Monday (24. Mar.) my wife Birgit (DL7IQ) and me are going to El Salvador and Honduras for the next 3 weeks. In El Salvador we got the call HU1M (by the help of Cisco, YS1CF, who is our companion). We will use a FT 890 + homemade pa (500 W) into a homemade 5 bander or vertical/dipole for lower frequencies. Please remember that we are travelling around all the time and have new locations often. And I can't promise that we are on the highest point around ...
We will take part in the WPX-SSB contest and around the 4./5. April we are on Meanguera Isl. (NA-190) for about 3 days. From here we plan to go to a Hondurian Island (Amapala Isl., belonging to NA-060). Here we use homecall/HR4. Most of those areas are out of common power supply so we have our own generator etc.
We hope to catch you on air.
regards Holger, DL7IO
PS. QSL route is DK7AO, via e-mail (hu1m@... for bureau cards) bureau or direct.

Hi

There are detailed instructions with photo's in the file sections look under dl7io for a very detailed PowerPoint presentation which includes measurements for the centre support and also look under ve7ask for details of building a bamboo hexbeam. I have downloaded the whole file section as different people find different ways of doing things and I am not one for reinventing the wheel :-)

I am still trying to source fibreglass spreaders locally, but when I start I will take photo's and post my progress.

As this is my 1st post to the group I will take this opportunity to say hello to everybody.

Have Fun

Hi Ernie,

Yes, it is true. I have done it with the internal tuner in my FT-1000MP, but it is a little tricky at times due to the limitied matching range of the Yaesu tuner. With the LDG AT-11MP, I have used the Hex-Beam (HX-5B) on 30, 40 and 80 m. I have observed remarkable F/B, but I have no idea what the gain might be. I asked Traffie to compare his 40 m Hex-Beam with the HX-5B on 40 m. His observation was that it was 1.5-2 S-units poorer at least. Not bad considering the 40 m HB is a barn burner. In any case, I has given me a capability that I didn't have before. Oh yes, I have also used it on 6 m with the RT-11 tuner and made a modesdt number of contacts (but I rarely get on 6 m).

BTW, Traffie doesn't recommend one way or the other to use the HB on bands for which it was not designed. Our friend David in VK-land is the one that first brought this usage to the group's attention!

Dick, I would suggest you to follow the same path DL7IO had.
Go for fishing rod blanks. I found a suitable one here in
PY-land for around 4 euro. They are of the telescoping type,
probably chinese made. I think one can't get cheaper than
this.

Another OM suggested me to go CPVC (gray) way, it's even
cheaper, but I'm not sure if they suit the need.

BTW...my hex hasn't started yet... But when I have some
progress to show, I'll post (and brag a bit :)

From: m0clz
Topic: 1412 Message: 1418

Hi

I have been having trouble sourcing fibre glass whips but have found 4 metre fibre glass whips at http://www.bigjohnsangling.co.uk/ they are ?5.49 each under the accessories section.

On the centre pole has anyone tried copper strips with bolts braised to them running along the inside as I don't want to run ribbon cable down the outside ?. Or are there any other ideas for feeding internally ?

Have Fun all

1420. Still Smaller Hex-Beam?

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-04-05 15:56:03 UTC
From: Paul Schaffenberger
Topic: 1420 Message: 1420

All,

The beauty of the hex beam from an antenna design standpoint is that the portion of the antenna that does the most radiating (the center portion of the quarter-wave) is placed forward (the two tips of the inverted W), while the ends, which radiate least are pulled together.

I have been working on some designs to decrease the radius of the hex beam even further. I've tried two ways of doing this, both involve a "t-bar" at the tips of the W. I have been successful at resonating a hexbeam with a radius of only 8' on 20M.

The t-bar is placed vertically at the tips of the inverted W. There are two techniques for increasing the electrical wavelength, one is by using an electrically "fat" element by using the t-bar as a spacer, the second is by using the t-bar as an active loading device.

I tried the former, using 2' t-bar element at the tips of the W, with the wires tapering to the feedpoint. I believe that using the t-bar as an active loading element may be even more effective, but I have yet to try that.

The implications for a 40M hex-beam may be enormous, as the size could be further reduced without a lot of performance implications. Since you are further driving more of the the radiation to the tips of the W, spacing should not be adversely affected. I will keep you posted on progress. In the mean time, I'd appreciate your thoughts on this approach.

Paul, K5AF

Sounds great to me Paul. I am about to start on a multiband version of the hexbeam. I built a single band one earlier and now would like to have a go at the multiband one.

I presume that in any tests you have made so far, you have restricted yourself to a single band version, or have you tried this in a multiple band situation yet? Have you any thoughts as to actual perormance such as forward gain and front to back ratios? Do they seem close to those of the standard hex?

You raise a number of questions. HI. I would like to see a diagram or picture of what you are telling us. I would have a better chance to grasp what it is you are doing. I for one would be interested in playing around with the idea.

Gary,
This system should play well in a multiband configuration, as the t-bar can be used on the lowest frequency band only.
This design uses a rigid, rather than a flexed, pole. I used fiberglass rod. At the end of the element is a vertical rod, which is a spacer. Instead of one wire going to the end of the rod, two wires that are attached at the feedpoint and at the distant end are spread apart at the midpoint of each element to make a physically "fat" conductor.
You probably have seen the MA-5B minibeam, this "fat element" concept is used on the reflector.
You could probably use single wire elements for the higher frequency bands, as they require less space.
I am going to build a ten meter version of this and test it. So far, the 20M version is a bit too ackward to raise above the six foot level.

From: t_ashland
Topic: 1423 Message: 1423

Hi to all in the group. I have been a long time lurker, first time poster. I finally took the plunge and purchased a HX5Bi. I am impressed with the construction of the antenna. It went together in an afternoon last weekend and put it up on the tower at 32 feet yesterday. I took the rotor down for some minor maintenance, so haven't had a chance to check the front to side and front to back, etc. I thought there was something wrong with the antenna because it is much quieter than the 3 element tribander I had up. However, the swr is pretty flat on all the bands, and signals are coming through. Conditions are not good this weekend, but made a few contacts during the EA RTTY contest Sunday morning. In fact, I worked an A4 station! It does load on 30 meters with the internal tuner on my FT-1000MP, but not so lucky on 40, hi! I have other antennas for 80/40 meters. I have read and re-read all the information as well as examined the pictures and files posted by this group. Thanks to all! Hope to check in to the Hex net sometime!

Hi Terry,

congratulations for your new Hex-beam!
I have home brew 5 band Hexbeam since few months. We have QSO with you in EA RTTY contest which I remember, because I missed only W0 multiplier! N4BP and AA5AU were louder than you at that time and the other few USA stations were on noise level (S1-S2).

1427. Homebrew construction help.

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-04-08 19:56:02 UTC
From: beavis
Topic: 1427 Message: 1427

Because of a major lack of $, I'm forced to homebrew a hexbeam. It looks decently easy and cheap to build one. I spent about three hours reading some of the posts here on the hexbeam group. I read a couple of the websites, viewed the files I could get to open, and looked at a few pictures of the hexbeam too. (what is the .ez file for?)
Anyways I'm looking for help in building one/instructions that are geared towards the less knowledgeable antenna homebrewer like myself. So far the things that look the hardest is going to be the element height on the legs of the hex and the height on the main pipe.
The hexbeamcalcv2.xls document seems to be the one I need for the dimensions(?), but I guess I don't understand how to read them. My last question is where to get the fiber glass rods. Is there anywhere in American that is easy to pick one up?
Thanks for reading and thanks for any help.

From: ve7ask
Topic: 1412 Message: 1428

Having built a five-band hex using spreaders made of bamboo garden stakes strapped together with hoseclamps, I am ready to tackle one of DF4SA's "Spider Beam" antennas.

Descriptions of that antenna are on Con's site:
http://www.qsl.net/df4sa/index_spider.htm

This one really does demand fiberglass spreaders. I found an inexpensive source at the Cabelas.com online shop.

http://www.cabelas.com/cabelas/en/templates/product/horizontal-item.jhtml?id=0011698115799a&navAction=push&navCount=3&indexId=cat20238&podId=0011698&catalogCode=ID&parentId=cat20238&parentType=index&rid=

I ordered four of the Classic Crappie Pole 16.5-foot telescoping poles, cost: US$9.99 each. They showed up five days later by UPS. Total cost for four, including shipping and border duties was a shade over $90 Canadian, or about US$55.

If the link above doesn't work in your browser, just go to http://www.cabelas.com and click "Fishing Rods" then "Crappie Rods".... Look for "Cabela's Crappie System and Rods"

Nope, I have no stake in Cabelas, but I remember how frustrating it was to have no local source of good spreader poles for my hex project, and how expensive other online options seemed to be. I hope this info will help some other homebrewer build a better hex than the one I clamped together. I love my homebrewed hex, but those bamboo spreaders are looking mighty shakey after a rough winter in the air.

Will let the group know how the Spider Beam project goes. It's a relative monster with a 33-foot boom, and full-sized interlaced wire yagis. If I play my cards right, I might even have the new antenna up for the last part of this weekend's JA International CW contest :)

If the spider beam doesn't perform, I will rebuild my trusty hex using the more durable fiberglass spreaders.

73,

Bud, VE7ASK

Hi Doug:

On page 21 it says: ". . . in San Francisco, California, the difference was 1-2 S-units in favor of the Hex-beam. We believe the difference noticed may be due to a difference in angle of radiation between the two antennas."

Hey, 1-2 S-units is "only" 6 to 12 db difference, not a minor difference!!!!!

And the article says: "We believe the difference noticed may be due to a difference in radiation angle." This sounds like the difference in radiation angle had nothing to do with the antennas themselves.

1433. Comments on the WorldRadio HB article

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-04-16 23:08:47 UTC
From: w4wb
Topic: 1433 Message: 1433

It was nice to see an attempt to make some OTA comparisions of the HB and another antenna. I have a few small comments about the methods and results.

First, it is a shame that the antennas were not located at the "proper" height --- 40' mast for the Hex-Beam. Yes, the HB works as does the TA-32Jr at 20', but the performance isn't the same as when at the proper height. On the other hand, those were the masts they had to use, so FB to running the tests anyway.

Second, using an S-meter for comparision is dangerous regarding interpretation of results. If you look at the data, the 7 dB difference in signal (10-50 W) resulted in 9 dB difference at one location and 12 dB at another. It is much better to use a calibrated attenuator at each receiver to obtain the same S-meter reading when monitoring the transmitter carrier switching between the two antennas. This removes the S-meter calibration issue.

Third, I wish they had made the comparision with a 3-element trapped beam (at the proper height) too or instead. That would have been a more interesting comparision IMO.

Nevertheless, I think they did a great service making the effort and reporting the results! Also thanks go to WorldRadio for publishing their article.

Hopefully others will make more comparisions and report on them.

I note that at the last Field Day, I used a HB that was about 56' AGL, which was too high (because that was the preset tower height). According to the model I use, the beam on 20 m splits into two lobes. Because the number of stations on during FD is high and because our station (K4BigFatTurkey) is rather "popular," I was able to "see" the footprint. For example, I could be working both 1's and 4's but no 2's at one time and then we could watch the shift over the 4's and 1's up to the 2's and VE's. THis year I have requested that the FD setup group remove one 10' section from the tower to solve that "problem."

Hi Barry and long time no hear!!

Regarding you observations of the radiation pattern with height! I can remember seeing other plots of radiation angle with height and I thought that many beams show a 'splitting' of the signal as the height increases? Even though, from memory the lower lobe is the biggest and at a lower angle than the lobe for antennas around the halfwave mark!

So therefore, for working DX it is still better to have the antenna higher and have the lobe split, than having one big lobe that radiates a higher angle! "So the theory goes, anyway!!"

I've just checked this out for a few beams and quads using some modelling software and they all look pretty much the same..

For example, a 20M beam at 10metres height has one lobe, with maximum radiation around 25-30?. Whilst a 20M beam at 20M height has a main and minor lobe. The main lobe is around 15? and the minor lobe is between 40-50?.

Whilst you lose a portion of your signal if you have the antenna at 20M above ground, the main part is radiating at a better angle for DX (~15? instead of ~25?).

I've never modeled the Hex, so I'm not totally sure that this is the case with it, but I'd be surprised if it isn't?? What angle do you get for your lobe at half wavelength??

I suppose if your looking at working W2 from W4, the higher angles would be better, but I'd prefer the lower angle for working VK2 back home to Blighty!!.

Anyway, that's my tuppence worth, and I always found my Homebrew Hex at 33 feet worked a treat.

Hope your well Barry and have a nice Easter.

All the best

David, VK2DPD

**** Generally so David. My comments were really focused on FD
work. Even so, I think the 5/8 lamdba for 20 m is about right for
the "work horse" height. Members in our DX club generally agree that
if you have but one beam, the 40-footish range is the best choice.
All of our BIG guns have one at 40', 65', and 90' (approx) with >90%
of the work being done with the lower antenna. W/O question, there
are times that the 90' brings home the bacon (so to speak).

**** I agree that most antenna behave about the same in this
respect. Same for the HB as far as the model goes. I still am not
confident that the model methods is proper for the Hex-Beam, but who
cares ... it works well enough to keep me happy. :-)

The model shows no significant lobe at 33.5' (ht. of 20 m element
mounted on 30' mast) with TOA of 28 degs. Traffie tunes his HBs at
43.5' (40' mast/tower). TOA is 22 degs with a 2nd lobe just forward
of vertical with peak at -8 dB. This is 5/8 lambda. At 65', you
have two lobes with the TOA of 15 degs and 49 degs. A -20 dB null is
at 32 degs. The upper lobe peak is -2 dB. This is representaive of
what I experienced at the FD last year.

>
> I suppose if your looking at working W2 from W4, the higher angles

> Blighty!!.

**** Actually, I am just trying to max the number of contacts. We
finished in the top 10 last year overall. Having a hole in the
coverage is a bummer IMO since contact opportunities are lowered.
This year I hope to have it at the 5/8 lambda height. That will give
(???) an elevation beam range of 7 to 43 degs at the -6 dB points (-1
S-unit). If the model is reasonably correct, this will give me the
performance for which I am looking. Hey, I would love to work more
VK and other DX during the FD, but we logged very few ... maybe only
one percent. Not counting the VEs in this. They were very active.

**** Tnx David. FB Easter to you and your family as well. Hope to
hear you on the air again soon. BTW, I just got the first of the LDG
AT-1000 autotuners. Handles 1 KW, small box, light weight, and nice
looking. Oh yes, it works great! Now I will have a means to
overcome the limitation of the tuner in the VL-1000. Amazing that
LDG is able to have a SRP of $599 for this unit. HRO, AES, and we
are selling it for less already as might be expected.

Doug:

A fast read of the article seems to suggest three comments: 1) the HB and the other antenna (brand X?) did about the same, with the HB a bit better at times; 2) the article does not seem to be very "scientific"; 3) based on the article, I'm not sure which antenna (if either) to buy.

I'm still extremely pleased with my HB, but if I were looking for a new antenna, the article would not have been of much help.

1439. HEIGHT AND ELEVATION ANGLE

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-04-21 05:04:16 UTC
From: Andrea & Chuck Bridges
Topic: 1439 Message: 1439

Interesting discussion about the relationship between height and elevation angle . . .

Chapter 23 of the ARRL Antenna Book has a discussion about elevation angles. The example in the text looks at the Boston-Europe path over the entire 11-year solar cycle. The key thing to note is that the elevation angle varies quite dramatically, in this example from 1 to 28 degrees. Clearly, some angles are more predominate, such as 4 degrees, 5 degrees and 11 degrees, but there are openings at significant openings into the teens and low twenties. What this suggests to me is that for consistent communications, I need to pay attention not only to the azimuth nulls, but also elevation nulls when putting together my antenna system.

Thanks for getting me to pick up the books again!

73,

Chuck AK6DV

1440. Re: HEIGHT AND ELEVATION ANGLE

From: w4wb
Topic: 1439 Message: 1440

Hi Chuck,

Good observations. If the 20 m Hex-beam element is at 43.5' (40' tower), the elevation beam goes from 4-46 degs at the -12 dB points and 7-40 degs at the -6 dB points. These values are based upon the model I used in EZNEC; however, it is my observation that Traffie's assertion that the field is flatten somewhat appears to be more or less valid based upon beacon monitoring and using W6ELProp to play with angles and hops. The beam in elevation seems to be depressed a bit from the model's peak of 21 degs and doesn't respond at the higher elevation angles as well as the model predicts.

I simple note that my observations are just that, observations. Making quantitative measurements of TOA to each beacon monitored isn't easy and amounted to tweaking values to attempt to match the observations. Of course, W6ELProp adds another level of uncertainty.

You could do that OM, but it isn't a real good idea. Try it in a
modeling program with any Yagi and you will see the results.

hello Barry (and the others),
Interesting thread. I have been playing with the idea also, mainly based on my VHF-experience with satellites and EME for which it is necessary to vary the azimuth. I don't have a modeling program, but could you tell what is actually going "wrong" with HF-beams?
greetings, Peter

Hello laasesmed,
the distance from the feedingpoint to the first connectionpoint on the spreader is half the length of one element leg or a quarter of the full element length (plus insulator length). For 20m it is about 2,80m-2,85m wire length. On the spreader it is a bit more close to 3m because the spreader needs to get the shape of an inverted umbrella.

I would be grateful for any comments re the followwing:

I expect to be moving to a new location and instead of retaining my small KLM tribander (KT34), biting the bullet and purchasing this rather expensive HexBeam 5 bander.

The KT34 has, despite it's small size, has been a terrific performer re apparent gain but not so hot on apparent F/B ratio. Wonder if any of you could comment on what to expect with the Hexbeam relative to a small tribander.

I have a 40 foot self-supporting aluminum tower. Since I gather that interactions with other conductors can affect performance in a major fashion, wonder how far above the apex of the tower to mount the Hexbeam and how far away any wire antennas, supported by the tower, should be from the tower.

Is there any information about take of angle at various heights. Does your experience support this surprising contention that 40 ft is an optimal ht?

Finally, since I am in the Boston area, can you tell me how this antenna is likely to fare under New England winter conditions? I realize that this is a light antenna with a low profile but what would the surface area be in sq ft. ?

Any advice would be appreciated.

Tnx,

Rich W1TSP

I am also in the Boston area (SE New Hampshire). I have only had my HexBeam (HX5Bi) one winter. It was a fairly harsh winter as you probably know. The HexBeam stood up well with no problems at all.
I have my HexBeam on a 52 ft. crankup tower but I have found that the best hieght is around 40 ft. Through some on the air tests I have verified that the f/b ratio is aprox 20db. on 15 meters. The side nulls are exceptional. A South American station said I completely faded out with the side towards him when I turned the HexBeam.
I don't think you will get the forward gain that you had with the KT34. Also, through some on the air tests I have pegged the HexBeam imperically at 6 - 8db forward gain.
I am very pleased with the HexBeam. It really is a solid performer and fits my situation well.

OK, so you confirm this interesting property. In that case would you
recommend that the antenna be at the apex of my 40 ft tower rather than on a
5 foot mast?

The crank-up tower made it easy to try different heights. I didn't see any improvement above 40 ft. or any degradation either. I would use the 5' mast if it were me.
They say "if you can see rust on your mast ... that your antenna isn't high enough".
I guess that it doesn't apply with a HexBeam.
I'm not sure which units Dbi or DBd (I am at work and on't have my handbook with me).
I any case 6 of them = 1 S unit. The gain is about the same as a 2 elememt mono-bander.

1456. Hex-Beam Happy in the Wind

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-05-06 19:30:11 UTC
From: w4wb
Topic: 1456 Message: 1456

We have had a night and day of tornadic wx, thunder storms, and HEAVY rains (> 8" in some areas). Winds were 40-50 mph with gusts over 60 mph. My Hex-Beam just sort of slightly rocked about in this wx and suffered no ill effects it appears. Hate to think how a Yagi in the same location would have withstood the wx.

Good grief! Yahoo went mad and started posting on its own. Kindly
ignore the prior two posts.

Anyway, I have been happy with the antenna. It is quiet and hears
well. Others seem to hear me well. I commonly get better reports
than I would otherwise expect and typically bust pile ups on first or
second call. I have about 300 entities worked. Added TX4PG
yesterday on 17 m CW. One of those first call contacts. I have no
idea how to determine the "true" gain of this antenna, but am
confident that it beats a 3-element trap Yagi. If I had the space
and such, the 4-element Fluidmotion looks very interesting; however,
it is BIG by comparision. If you looks at occupied volume, then the
Hex-Beam is a lcaer winner over anything I know of so far.

About the storm ... I massive tree made a neighbor's car a very
compact one due to the storm. The HB just "ignored" the wind. Its
near-symmetrical design takes off the torque on the rotor and mast.

73,
Barry - W4WB

1461. Dayton

Hey guys,

Anyone going to Dayton this year? I will be there on Friday. I really want to meet Mike and see how things are.

I still give my endorsement for the Hexbeam. It is perfect for what I want in an antenna. I have been QSLing lately and I just got BG2EX's QSL in the mail. Talk about exciting!!! WHOOHOO!

Anyways... my new QSLs has my Hexbeam on it.

We need to start getting skeds together... have not talked to W6HB and W4WB in a while... (I miss you guys :0)

Anyways... N8XE is still here and cooking with gas with the Hexbeam. Also, please note to anyone who is considering the Hexbeam, my site has recordings of the difference between a Hexbeam and an inverted V dipole at the same height.

Hi Folks,

I spoke with Mike this morning and verified that he will NOT be at Dayton this year. Instead, they will be showing at the Rochester Hamfest about two weeks after Dayton. Rochester offered him a great location in the middle of the "Dome" while he wasn't able to get a similar location at Dayton. Being that they are so close together, it is difficult to even consider doing both.

Hello OM, if you look in my photo section , you will find the
photo " attachement". This is a very cheap way of connecting (it is
used for connecting metal wires) and it allows you to alter the
lenght afterwords, so don't cut the wire but bend it around the
bolt, the same for the ather end (of non conductive material)
Hope this helps...

Hi KC8TLF,

I'm using a plastic rope for drying clothes - $1/20m, few meters donated by my XYL..hi..hi..
Wire end is connected directly to the rope without any insulator and it works at 1kW here.

From: on4ccw
Topic: 1471 Message: 1471

Hi all, i had my homebrew beam for about 8 months now and worked indonesia, japan, canada, america, south africa and so on...out of europe; all with 100 watt. So no complaints here. I have some fiberglass rods now, so i'll repace my bamboo spreaders in the future.
As i'm making chances, i would like to add a 6 meter element , fed with an separate coax cable.The other elements are all fed with one cable according to the instruction of Holger and are fine.
Any remarks?
Maybe an "mmana" goeroe can predict what will happen???
Thanks for the info
PS: i have had trouble with my light TV rotor : it is the second one that breaks down, when the antenna turns because of the wind; at an sudden moment in time it is near the "dead" turning point on the nord side of the rotor.As the wind turns the antenna away from this point, and towards it again, it gets small "bangs" and breaks eventually.

Well, so far my homebrew hex beam is down in signal from my offcenter fed dipole. The only band I can get it to tune on with an swr under 3:1 is 20 meters. I still have more tuning to go, but I'm still a tad frustrated.
I was looking at quads on eham reviews and found this link.
http://www.mgs4u.com/
It says they are a wholesale supplier of fiberglass.

"Max-Gain Systems, Inc. is a wholesale supplier of fiberglass tube and rod to many of the best-known names in antenna manufacturing, both in the ham radio and military markets. We supply more fiberglass to more antenna manufacturers than any company in the world. We also supply fiberglass to many other industries, such as ultralight aircraft, tool handles, tents, driveway markers, towed aircraft banners, electrical utilities, universities, national laboratories, and the inventor with an idea for a new product. We are a unique source for sleeving adjacent sizes, in stock, and in even single piece quantity for prototyping! No need to pay for mill-runs just to see if a prototype will work.Our contacts and relationships allow us to provide superior product at lower cost than a single commercial user dealing direct with a single factory. Let us quote on your needs!"

Topic: 1412 Message: 1473

Yes, I have tried that. I used copper plumbers coil, which has
punched holes about every 3/4 inch or so. I soldered brass bolts
through selected holes, and easily threaeded them through a two
inch OD plastic pipe. I also ran a third strip down the
interior "back" of the pipe and tied all the reflectors together.
A ten foor length of that coil is more than plenty to make the three
strips that I used.
Good luck - Doug - VE3CWO

1474. Hex-Beam Upside Down?

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-05-20 22:34:32 UTC
From: Dan Fitch
Topic: 1474 Message: 1474

I live in a deed-restricted development . Sigh.

Have any of you turned a hex-beam upside down, so that it looks more or less like an umbrella? How well does it work?

Picture this crazy idea. I□m seriously considering the construction of a wooden gazebo in the back yard, hexagonal of course, and thought that I might disguise a hex-beam in the roof. The dimensions would be about right for a 17M-6M version. 20M would really be stretching it, unless it was inductively loaded. Some of the available umbrella coverings are pretty impervious to weather (I live in Florida) and transparent to HF. The spreaders could be supported/stabilized by wheels in a notched track around the top of the gazebo frame, and a rotor hidden in the floor, with a wood or PVC □mast□ up the center. Am I desperate, crazy, or what?

Do any of you have any (constructive) suggestions on this (besides moving or committing myself)?

Oh, and since most outdoors structures are screened with Mylar around here, due to the critters, the screen door would be locked before operating the rig .

1475. (care and) Feeding your multiband Hexbeam

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-05-20 01:24:35 UTC
From: john_dilo
Topic: 1475 Message: 1475

I have a question about feeding a multiband (10, 12, 15, 17, and 20 m) hexbeam. Most of what I have seen on this group and elsewhere on the web suggests that a common feedline is used. Doesn't that affect performance on 10 and 12 m? These two bands are very close, so one would expect these elements to de-tune the other. Also, since 10 m is harmonically related to 20 m, won't the 20 m element radiate some on 10 m transmissions, and again, detune the antenna here?

Thanks for the bandwidth.

regards and 73

Hello John,
you are absolutely right. 10/12m are influencing each other very strong. But it is the same with separate feeding. My experiences were that the neighboring bands are influenced while changing any element length. I had no problem with 20/10m.
I was trying to find a solution for a feeding with 50 Ohm coax cable (easier to rebuild) but I got only 4 bands working. 20-15m was no problem but I could only add 10 or 12m not both together. I did not invest much time on those experiments because I was using a friends property that time and had to build up and remove the whole antenna system everytime/everyday...
I may start again on this in late summer when we moved to our own property.
regards Holger

John; I have just gotten around to reading this weeks emails. In regards to the de-tuning of adjacent bands. I have a 5Bi and my experience has been my Kenwood TS 930 sees approximately 1:5 to 1:9 on 4 bands without the tuner. The exception is 20 meters. I need to use the tuner on that band. My Icom 706MKIIG provides a low swr on all bands without the tuner. Except of course when there is snow or ice on the wires.(both radios)
I'm not into nor do I understand the physics behind most antennas. Certainly not the Hex Beam. It just seems to work and works well indeed.

From: richlim11
Topic: 1479 Message: 1479

Well I have been on this list for several months now and am embarassed to say that I have had Hexpack s/n064 for 9mo without ever taking it out and using it. This all changed yesterday. I finally took the beam out and set her up for 20m. MAN-O-MAN, I should have been using this thing all along. I truly heard thing on the Hexbeam at 20ft (on the patio deck and portapole) which my minibeam at 35ft did not hear! I called a fellow in NY state from Chicago and did an on air comparison, I was at least 2 S-units (12dB?) better on the hexbeam vs my usual antenna! I know know what all the hype is about. Hopefully, I'll be able to convince the XYL to let me mount a 5b Hexbeam on the roof! I guess that I am now one of the believers.

Rich,
check your minibeam and it's installation. I guess there will be something wrong with. Or simply change only the beams for a comparision but leave all cables etc. Nevertheless it is important that you noticed the bad working system!
regards Holger
PS. A35WG who is currently active uses my homemade beam. He counts for HXCC.

Hi,
Be careful. If the weight of your wires and the spreaders is too much (or if you get icing in winter, you might "droop" the speaders too much and break them, or you will probably have too much slack in the wires and they will droop. (I guess that depends on whether you use PVC, fiberglass, bamboo, etc). When the speaders are "up", gravity helps keep the wires taught.

Just a thought,
Stu

Hi Dan,

Gravity kills! Not a good idea IMO. Do a few quick calculations and determine the added force at the hub on each arm. Gravity helps to balance the forces induced by the bending up of the arms by the several wires when mounted in the normal manner. One could extend the mast (in the inverted case) several feet and connect a line from the tip of each arm to the top of the extended mast as another means to balance the forces. Try to explain that "new" look to your neighors. ;-)

1485. Fw: hexbeam upside down

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-05-29 14:15:52 UTC
From: Ed Cuypers
Topic: 1485 Message: 1485

Because of the feeding system, one can't place the hexbeam upside down. Not with a steel tube going through the hub, as a support for the beam, in any case. The steel tube would be too close to the feeding point and would make the antenna useless. One can't place the antenna with the pvc tube on a steel tube either, because the pvc tube will break.
I think it could be done if you replace the pvc tubing with a fibreglass rod to replace the pvc tube and attach your feeding system to that rod. The wall of that rod should be tick enough to support the antenna or use solid rod.
Because the antenna is upside down now, your spreaders should be strong enough to provide enough tension to keep the wires stretched.
Don't disguise the antenna as a umbrella. Hi!Hi! It will take to much wind and raises suspicion in the neighbourhood. Who puts his umbrella at 30 feet?

Hello,

I tried the Excel design tool found in Files section of this group. I am afraid 1 inch = 2.54 centimeters, not 2.56.

Example: for 28.1 MHz the Excel sheet says 5.63 meters for driven ele. It should be actually 5.59. With 5.63 you would get (theoretically) as low as 27.9 MHz.

But I assume it is necessary to experiment a little bit anyway and cutting wires might be a bit easier than pulling them longer ;)

Hi Peter,

I think Ed was talking about going through the mast, not along side of it. You are correct that one may mount the HB offset with the "new" mast running between the driven and reflector elements on the cold side (side the coax shield is connect). Others have done this with no problem as long as the antenna above doesn't electrically couple with the HB.

Nice installation and photos!

Topic: 1489 Message: 1491

You can try Max-Gain at http://www.mgs4u.com/fiberg.htm <http://www.mgs4u.com/fiberg.htm> for fiberglass.

One thing to note on the tubing is that it comes in 8' sections, and you'll pay a fortune for shipping at that size. You can have them make cuts for .50 cents each down to 4', which just fits the normal UPS limits.

I haven't ordered from them, but was playing with a design like:

3 qty 8' 3/4" tubes cut in half for 6 4' pieces
3 qty 8' 1/2" tubes cut in half for 6 4' pieces (fits inside 3/4" tube)
3 qty 8' 1/4" rods cut in half for 6 4' pieces (fits inside 1/2" tube)

Ask them to sleve the pieces before they make the cuts, so that will only be a few cuts. You'd then have 3/4" tubes tapering to 1/4" at the end. They would be about 11' long, assuming a 6" overlap where the joints are. (BTW, how long are the real HexBeam spreaders ?)

If anyone has opinions about if this sounds right for size and flex, please let me know.

73,

- Dave

I had the HX-5B at about 56' for 20 m last year at FD. I could tell
that the beam had broken into lobes and was costing me contacts
(nevertheless, our club finished 9th overall - K4BFT). I have
requested that the 20 m SSB station tower be set for 40' this year so
that the 20 m elements will be about 44' for no multiple lobing. It
is quite a sight to see the fine members of the Huntsville ARC set up
4 to 5 50' towers in about two hours. They have it down to a fine
art and are ready for those emergency situations requiring rapid
response. They are truly an impressive group (and they make sure the
food is outstanding as well)! I'm just one of the operators they
grab from our DX Club to man some of the stations. :-)

GL Rich es hope to hear you FB,

Hi Pete,

Traffie tunes them at about 43.5'. Take a look at the model and you will see that the elevation lobe splits. I have my HB (20 m elements) at about 38' and works fine (single lobe). When I had it at 56' for FD last year, I could easily detect the lobe spliting. Is it a real problem? Not really perhaps, but I suggest that you will find it to be better for most work to be at the 43' level. BTW, the model indicates that the third lobe (at 56') points up and a part of it even backwards a bit. Well, I made some NVIS contacts too in AL, MS, and TN (I'm located in north Alabama). ;-) Remember that there is energy transmitted in each lobe, and energy received in each ... QRN/M potential.

1500. Elevation Angles - Optimum Height

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-06-22 03:49:14 UTC
From: David Douglass
Topic: 1500 Message: 1500

Hi All,

I've just uploaded a Excel File to the files section which shows elevation angle information for the 5 Band Hex-Beam at different heights (between 5 and 20M), and for all 5 bands.

There is a section in the ARRL Antenna handbook that details the optimum radiation angle from various areas in the US, to the rest of the World. Therefore in theory you can set your tower height to the optimum for a particular part of the World you prefer to work.

Sounds easy Eh?? Well if you prefer to work one location, on one band, only using 1 path (long or short) it is. However, if you want optimum height, for all bands, on all paths, to all locations you want to invest in an automatic telescopic tower!

From: David Douglass
Topic: 1501 Message: 1501

Apologies for posting more data!! You can tell I was bored this afternoon and was playing around with my antenna modelling software!!

I just ran a model of a 5 band Hex, at 10 metres high, for each band and come up with the following...

Model Data - 5 Band Hex at 10 metres
Freq SWR Gain (dBi) FB (dB) Elev Angle (?)

28.05 2.21 8.7 6.31 14.3
24.9 1.54 8.99 9.23 15.8
21.05 2.13 9.54 10.97 18.2
18.08 2.28 10.05 11.96 20.5
14.05 3 9.3 9.76 24.5

Whilst I think you can sometimes take modelling data with a pinch of salt, I always had the feeling that the best band on my Hex was 17 metres, and that performance on 10 metres was poor when compared with other bands. As the above data shows gain and F/B are best at 17 metres and worst at 10 metres. Coincidence or what???

Also tried to model the antenna for the 30 metre band, and got a bi-directional pattern similar to a dipole. This was interesting as many found the 5 Band Hex had directivity on this band?? I, on the other hand always thought it was omni-directional.

Again apologies for the bandwidth, but I've got to find something to do as it's the close season for football!!

Regards

David, VK2DPD

1502. Installing a 40' push-up mast

Yahoo group: hex-beam (2001 — 2006)

From: k1mzg
Topic: 1502 Message: 1502

Greetings all,

I've decided install the HX-5Bi hex-beam on a 40' push up mast. Any suggestions or comments are appreciated.

For one thing, what are the recommended guy wires? I previously have put up a 30' mast and used galvanized wire for guys and merely twisted the ends where it connects to the mast and ground anchors. Are there better kinds of wire for this? I was thinking of getting wire rope and using clamps.

The second issue is putting up the mast itself. Previously, I put the 30 footer, telescoped down to 10', in a small hole with rocks in it. I then guyed it and, standing on an 8' step ladder pulled up one section at a time. I did the whole thing myself, but the mast wasn't supporting anything. I figure I could do the same thing with the 40' mast with 3 friends helping securing the guy lines.

So the plan is:
1. Assemble the hex-beam
2. Install the rotator (Channel Master) on the mast and put the mast in it's support hole. Secure first set of guys.
3. Install the hexbeam on the mast/rotator.
4. Push up the top section of the mast to 20 feet while the 3 friends are holding the guys. Put in the locking pin, securing that section.
5. Do the same thing (#4) for the 2 middle sections. It's only when the mast is all the way up that the top 3 sets of guys can then be secured.

Any thoughts or suggestions on this plan? I think I prefer doing it this way that to tilting up the whole 40' feet of mast from the ground. Than seems like it would be ungainly andmight fall.

Thanks for any help. I'm ordering the hex-beam today!

73's

Michael, kd5wby

Mike,
I would suggest using 3/16" UV resistant dacron rope rather than wire.
My hexbeam is on a 30' mast and I've had no problems using the dacron rope
over the past two years. It's held up well. Ed, N0OQ

HI Mike,

Ed is correct. May I suggest SYNTHETIC TEXTILES rope from AES. See
http://search.cartserver.com/search/search.cgi?cartid=a-
6994&category=newprices&maxhits=200&keywords=synthetic+textile

Works great. BTW, never use wire guys with the Hex-Beam.

My HX5-Bi is installed on a 30 foot push up mast, guyed at two levels with 5/16 double braid dacron rope. However, I mounted my rotator (G1000-DXA) 2 feet above ground. It turns the mast and antenna with no problem. Rotator is mounted on 5 feet of steel pipe (3 feet in ground) and about 200lbs of Quikcrete. I can raise and lower the mast/antenna down to 10 feet with no problem. I would be caustions about having the rotator mounted at top of mast as it will become very unweildy. Actually, the most difficult part of the project was mounting the antenna on the lowered mast then getting it upright on set in the rotator. This step is easily a two (possibly three) person job. About every 2 weeks I check the guys to make sure all is okay, and about twice a year lower the antenna to do check over. Been up for about 27 months. Hope this helps. Bill, I use the Traffie heavy duty mast (which is anodized bronze so it blends in with the trees). Comes with pair of good quality guy rings that allow the mast to rotate easily. The guy ropes are tied to ... get this ... dog run screws. These are very large cork screw stakes that you screw in the ground that you tied you dog to. I installed three of these and tied a pair of guys to each. If the earth is solid they hold very well. Not sure where you're located. I'm in Yardley, PA near Philadelphia / Trenton..so if local you're more than welcome to come by and take a look. Harry WE1X ----- Original Message ----- From: sysop@... 1508. 40M and 5 Band Hex Beams "Nested" ???

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-06-24 16:54:31 UTC
From: blkwynd2000
Topic: 1508 Message: 1508

Hi Guys,

I am building a new QTH out in the country where I will finally be free of CC&R's and neighbors who do not see Ham antennas as a thing of beauty...I sure you know the story.

Anyway, among the 2 or 3 antennas I am considering would be a 40M Hex mounted below a 5 band Hex on the same mast. I will be using a 72' motorized US Towers crank-up, so I can easily position the 5 bander at about 42 feet and then raise the tower up to full height for use on 40M...that's the thinking anyway...

I would appreciate any thoughts on what seperation I should consider achieving between the two antenna sysyems.

The Hex Beam is like all antennas a commpromise, but the 5 Band / 40M combo looks like a great solution given that I will be spending a lot of time on 40M given the current sun spot realities.

Thanks in advance for any feedback, especially experiences with the 40M Hex.

Hi Harry,

I would ask Mike Traffie about this. He has had experience stacking the 40 m HB with other antennas.

Topic: 1508 Message: 1511

I have been considering the same installation. Adding a 40M to my 5 bander. In conversations with Mike he has indicated that the 40M should be placed on top of my 65 foot tower and then the 5 bander lower on a side arm for best results.

From: Andrea & Chuck Bridges
Topic: 1512 Message: 1512

My set up is very similar to Harry's. I live in the San Francisco Bay area, unfortunately in the "brown grass" area and not by the ocean. The wind here blows strongly most of the time -- I check the guys frequently. I have had not problem, althought some evenings I have expected the whole thing to come tumbling down in the windy blasts. I use earth screws (pretty similar to the dog run screws) to anchor the guy ropes. I found them on the Web, but I have seen similar versions in the garden section of our local hardware store.

The mast comes with two slip rings that slide down over the top of the mast and rest on the tops to two sections. The slip rings have holes to allow for the attachment of the guy ropes.

My wife and I put the mast/antenna combination up on a still day. Frankly, I wouldn't try it again. You need a couple of helpers to steady the mast as you raise it.

73,

Chuck AK6DV

1513. considering hex beam purchase

Yahoo group: hex-beam (2001 — 2006)

Dear Hex Beam Group:

I am truly perplexed ... maybe a little skeptical. Why does this antenna appear to have such a following? Why does this antenna defy the Elmer Golden Rule, "Cheap But Effective"?

I am seriously considering an alternative to my present vertical installation (HB-5V ...$50 second hand). I am not trying to roust up a huge amount of attention because I am lonely. I am truly curious about this antenna.

Thanks for comments in advance.

1. Why not a 2 element 5-band quad?

2. Why not a screwdriver antenna mounted portable?

3. Why not a 6 element log periodic?

4. Why not a C3SS?

5. Why not build a homebrew moxon?

6. Has anyone mounted this on the military surplus aluminium mast system?

Hi John,

1. Why not a 2 element 5-band quad? - Smaller 'foot-print', much better windloading, easier to tune (maybe), but if you have the room - go the quad.

2. Why not a screwdriver antenna mounted portable? - Poor performance.

3. Why not a 6 element log periodic? - Smaller 'foot-print', much better windloading.

4. Why not a C3SS? - Why not?

5. Why not build a homebrew moxon? Why not build a Hex? The Hex is a lot more mechanically robust and smaller, but probabaly not quite as good performance-wise.

6. Has anyone mounted this on the military surplus aluminium mast system? - Sorry Can't help you there?

IMHO Anyway..

Best Regards

David, VK2DPD

John - here are my comments on your hex beam questions. I've had my 5 band HexBeam in the air for over three years now without problem. I chose the antenna for my installation because of its special physical characteristics (small size, light weight, structural rigidity) and I don't attribute its performance to any magical qualities. Under different circumstances, I'd have likely chosen a different antenna - maybe a TH-11DXX. There are definitely cases where the narrow beam width and high f/b of a multi-element yagi are distinct advantages.

> Thanks for comments in advance.
>
> 1. Why not a 2 element 5-band quad?
>

A good alternative, but (and I've had three quads):

a. A quad is far more difficult to get into the air
b. The quad is an inherently unstable structure. Movement of the spreaders in the wind will eventually break the wires or their connection points.
c. The quad takes up more space
d. The quad is more visible - spreaders are larger
e. Higher mass of the quad makes use of a light duty rotor a questionable decision

> 2. Why not a screwdriver antenna mounted portable?

Is that a serious question? The hex beam has gain and directivity without the inefficiency of a shortened mobile antenna. And - no tuning is required!

> 3. Why not a 6 element log periodic?

Much higher weight, larger rotor required, heavier duty supporting structure required, much larger turning radius, little if any advantage in gain and f/b ratio.

> 4. Why not a C3SS?

Not in the same league. The C3SS, according to the Force 12 website, has little gain on 17 and 12, and a very small f/b ratio on those bands. Have you looked at the advertised SWR for 12 and 17? On 12 it's 4:1 and on 17 it's 2.8:1. Will the C3SS take 1500 watts? Not clear on that from the website. If you plan to use an amplifier, you'll undoubtably need a tuner as well with SWRs that high. Even on 15 and 10 meters it has a 2:1 SWR.

> 5. Why not build a homebrew moxon?

Why not? When you resolve the complexities of a five band model on one structure it will be interesting.

> 6. Has anyone mounted this on the military surplus aluminium mast
> system?

I've seen those at Dayton every year. Never saw anyone actually use one, but lots of guys buy them.

Hi John,

My responses below:

> 1. Why not a 2 element 5-band quad?
>

That is a fine choice. A two element, 5 band quad from Lightning Bolt antennas is 289.00. If I did it all over again, I probably would have went this route because of cost/performance ratio. Don't get me wrong, the Hexbeam is a great antenna and I love it. However, I can do quite a bit with $600.00. Only drawback is I think quads have a tendancy to not stand up to the elements as well. YMMV.

> 2. Why not a screwdriver antenna mounted portable?
>

Sure... and wonder why you cannot work that station in China :)
Actually, comparing a Hexbeam to a vertical like that is like comparing a pinto to a corvette (any beam to a vertical/dipole). Are you looking for gain/directivity? Then don't go with a vertical.

> 3. Why not a 6 element log periodic?
>

These things are big and heavy. If you have the tower, then go for it.

> 4. Why not a C3SS?
>

3 bands. Basically a dipole on the WARC bands. On the Hexbeam, you get gain on all four bands (like the quad mentioned above).

> 5. Why not build a homebrew moxon?

If you have the desire, then go for it. Save you some money as well. You could also make your own Hexbeam. But from what it looks like, you may need to do some experimentation on getting it right.

>
> 6. Has anyone mounted this on the military surplus aluminium mast
> system?

Some guys on the list has used the push up mast from Traffie. They report good results. If you have the guy space, go for it! The Hexbeam is so light that the mast would do fine.

73 and let us know your decision! We would love to hear from you no matter what you choose.

John:

I agree with Jason. I think a good quad will do the job just as well but can it stand up to the weather elements? The difference in the antenna cost is made up for by the savings in the rotor and tower requirements. This has been completely no hassle for almost a year and the signals are great especially in comparison to a wire or typical vertical.

Topic: 1519 Message: 1520

A Hex-Beam isn't a Spider Beam. Both are wire beams and are folded, but differently. The HB uses 6 support poles while the SB uses 4. Both also use the center post to attach their respective wire elements.

The Hex-Beam has two elements folded as reversed Ws while the Spider Beam uses 3 elements on 15 and 20 m, and 4 elements on 10 m. The Spider Beam elements are folded more as a V in a 3-D space. The Hex-Beam is very compact (< 20' turning radius for the 10-20 m version) while the Spider Beam has almost a 30' turning radius.

The HB covers all five bands in the 10-20 m spectrum while the SB covers only 10, 15, and 20 m. Weight is similar, but basically due to the lesser wire used on the SB (has two fewer bands). Wind loading torque is higher on the SB than the HB simply due to the symmetry of the HB.

The HB is very very proven in the field and has many hundreds of users worldwide. The SB reportedly works well also, but has a much smaller user base and significantly less history.

There is another Yahoo Group for futher SB discussion.

After reading this reflector for a year and effecting a change in my home owners association rules, I finally ordered my HX5Bi Hex Beam this week. So hopefully, there will be one more on the air in the near future.

I've read all the posts on the yahoo site and the reviews on E-Ham.net. Looked at a fair number of installation pictures by now. Really good starting information.

With that as background, I'd like to solicit any suggestions, ideas, help, etc. before I start installation.

I will be installing the HX5Bi on Mike Traffie's ~30ft HDX mast. I still have to deal with antenna restrictions so the antenna has to be behind my house and can't stick up over the roof (be visible from the street). It's gotta be as stealthy as possible.

Question 1. I've seen a number of posts about painting the Hex Beam to enhance stealthness. So say paint it flat black. Others say gray or brown. From behind my house the antenna will be contrasted against a black pitched roof. From one side it has the sky for a background; from the other some trees. What do you all recommend as the best compromise stealth color to use?

Question 2. I plan to use Mike Traffie's HDX mast and rotate the beam with a Yeasu G-450A rotator. I understand that this rotator is probably overkill, but I'm more comfortable with over-engineering than the opposite. Based on Mike's recommendation, I plan to ground mount the rotator. That gives me some personal problems with the need to use guy ropes. So, does anyone have any lessons learned worth sharing regarding this type installation? Any alternatives?

Question 3. Any other thoughts, hints, tricks, traps, etc. not covered on the web site?

Thank you all and 73... Bill K3WA

Bill, My HX5-Bi has been installed using Mike's HDX mast for over two years. Mast is guyed using double braid dacron rope. Suggest a few days after installation you check the guys for stretch / slack and adjust. Do this every few days. However, be careful NOT to tighten the guys too much as doing so will bow the mast. Have enough tension to ensure the mast/antenna does not wobble in wind. Regarding the rotator. My rotator is ground mounted on 5 feet of heavy steel pipe about 3 feet in the ground. I used about 5 or 6 bags of Quikrete for the base. Initially I used the Yaesu G-450A rotator. Theoretically this should be adequate. However, I noticed a couple of things. First, the total weight of the mast and antenna is about 40 lbs. That is a considerable amount of weight directly on the rotator. While the rotator should handle the windload just fine, the amount of weight directly on the G-450 may come close to the K factor maximum rated for the rotator. Second, if your area is known for inclement weather there may be ice loading which may affect the rotator's perofrmance. Finally, the control box for the G-450 is cheap. There is a history (mine included) of the clockwise and counter clockwise switches breaking quite easily. Parts and support from Yaesu are not forthcoming. I replaced my switches with same parts from Burghardt's (while Yaesu told me 10 weeks to order). After fixing the control box I elected to spend some extra money and move up to the Yaesu G-1000DXA rotator which is overkill....but gives me peace of mind. I would recommend at a minimum you go with the Yaesu G-800 model. Inital installation of mast and antenna on top of rotator is easily a 2 person job..3 would be better. Raising and lowering the antenna on the telescoping mast for checks and servicing can be a one person job with step ladder. Suggest you have WD40 handy to squirt in the mast joints to reduce some friction/drag that may occur when you try to raise the mast again. good luck, Harry WE1X ----- Original Message ----- From: axelrodw Date: Tuesday, July 1, 2003 7:26 pm Subject: [hex-beam] The adventure begins > > > > > After reading this reflector for a year and effecting a change in > my > > home owners association rules, I finally ordered my HX5Bi Hex Beam > > this week. OK, paint one side blue, one side green and another side black. Than make sure that the orientation of the antenna when you shut down is such that each color is on the correct side.

Also make your mast extendable...preferably with a motor drive...after dark you can push it up above the rooftop...probably do most of you operation after dark anyway.

Then grow some 8 foot trees at the front of the front lawn near the sidewalk. They wont interfere with the antenna but they will make it impossible to see the antenna from ground level because the angle to the top of the trees from the street will be too high.

Hi Bill!

Congrats on your purchase. I don't think you will be dissappointed. My Hexbeam is at 32' (or 64' using Barry's physics HIHI ;-) and it performs quite well. I am starting to use QRP power levels and seeing what I can get by with... Liechenstein with 500mW!!

Hints, thoughts,... the only thing I can offer is it does not hurt to over engineer your installation. It is always best to err on the safe side. I have a G450XL which does pretty well for me. However, it is in the tower itself and not supporting a 30' mast.

Have fun, and BE SAFE!! Do not take any risks that are not necessary!! Your antenna is not any good if you are SK!!

Let us know when you get the antenna up... we would love to hear from you with your new antenna..

73!!

1528. FD Report a little long

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-02 12:56:42 UTC
From: Richard Lim
Topic: 1528 Message: 1528

Hello gang, just a quick report from FD. I took my Hexbeam portable to our club's FD effort in Possum Hollow Forrest Preserve. The location is about 25mile West of Chicago and was an old rock quarry which was landfilled some time ago. The location is not ideal as there is about 2 inches of topsoil then 30 million tons (+/- a few tons :-)) of rock from Chicago's Deep Tunnel Project (another story) filling in the old quarry. As you can imagine, not the best location as far as achieving a good RF ground.

Nevertheless, the Hexbeam was mounted on the HXP mast on a 2ft piece of 3/4" conduit and guyed 6 times with 3/16" rope. No rotor, just strong arm technique. Additionally, I had placed a multiband dipole ala W5GI design at about 50ft to have a second antenna. The Hexbeam was locate about 30yds from this dipole. On to the good stuff.

The Hexbeam worked wonderfully! We had varying WX condx with wind, rain and sun! There was no issues with the beam and mast despite the wind and less than ideal setup. Too bad I couldn't put an umbrella element on the beam to help keep us dry.

Comparing the dipole and beam was very interesting. Even with stations exactly to the broadside of the dipole, the Hexbeam easily outperformed the dipole in both RX and TX. The noise level was about the same, but I could copy things on the Hexbeam which were not even S0 on the wire. The real interesting thing was the comments people were giving me. I was receiving comments of "Great signal, 20 over!" while I was receiveing them at S8-9. I was only using 100w and I'd assume that there should be reciprocity with signals assuming same power levels. Interesting phenomenon.

Finally I guess proof is in the pudding, our Q-rate approached 60-70 Q's per hr at times with the Hexbeam VS 20-30 with the wire last year. Also we made 625 contacts in about 20hr VS a little over 200 last year with the wire in the same time! I know that there are diffences in condx but I really believe that the beam helped us do much better than last year! I really like the beam and have enthusiastically recommended it to others! Great job Mike!

Take care all and thanks for reading!

1530. Field Day

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-03 13:57:43 UTC
From: Stuart Bloom
Topic: 804 Message: 1530

Hi,
Our club station, W5PDO, also had a Hexbeam 3B up about 50ft for field day. One of our club guru's built a half tilt half telescoping mast rig (square steel tubing, cables, electric winches)onto a surplus trailer. The top of the mast has a Yaesu Rotor at about 50ft. This was our primary station for 10/15/20 meters.

Worked great. I don't have any comparisons with a dipole or other antennas, but from Los Alamos, NM, we got some DX from Nova Scotia, Florida, Cuba, Alaska,and Moscow, RU (yeah, I know it doesn't count, but who's going to refuse a QSO from Moscow here in the southwestern US??

All antennas are a compromise. This antenna works for our emergency portable HF station. It is light, portable, easily setup and broken down (after you've done it once or twice).

1531. Hexbeam height

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-04 11:55:40 UTC
From: Pete Meier
Topic: 1531 Message: 1531

My tower is a 48 footer so my 5 band Hexbeam sits at about 50 ft.
Since the hexbeam optimum height is 40 ft. would it really be worth the
trouble to take out a section of my tower?
Would I realize a noticeable difference?

I would appreciate comments from anyone who has "been here, done that".

Thanks,

Pete WK8S

1532. Six Meter Halo and Hexbeam

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-04 15:42:42 UTC
From: Jason Hissong
Topic: 1532 Message: 1532

Hi guys,

I have been playing around with 6 Meters lately and I am thinking of getting a Par 6 Meter halo. Was wondering if anyone has had any experience with a Hexbeam and a Halo underneath. I know that Mike has stated that a beam under the hexbeam makes the hexbeam think it is ground. However, what about a Halo? I have the perfect place for it on my tower underneath the Hexbeam...

Anyways... thanks for the Info...

Jason
N8XE

BTW... The only reason I am going for the halo right now is the minimal investment for now. I think the halo will do fine for what I want to do. With the 6 Meter hex, I would have to get a rotor (albeit small and cheap) to get that going....so I am looking about 200.00 for it whereas the halo is much cheaper (plus the XYL is watching me like a hawk :)

1533. 17/20 meter Hex-Beam dualbander?

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-04 17:33:51 UTC
From: Don Snodgrass
Topic: 1533 Message: 1533

Hello all..

I am contemplating the purchase of a Hex-Beam for use only on 17 and 20 meters. However, I note from the below table (from the Hex-Beam website) that apparently a dual band antenna for 17 and 20 is not currently available. Has anyone discussed this with Traffie Technology? Will they custom build a dual band antenna for 17 and 20?

Model	Band	Price
HX-1712i	17-12M	Special Order $559
HX-2015i	20-15M	Special Order $599
HX-5Bi	20-17-15-12-10M	$889
HXL-1510	15-10M	$299

From: hex-beam@yahoogroups.com
Topic: 406 Message: 1535

Enter your vote today! A new poll has been created for the
hex-beam group:

What are the reasons you bought,
homebrewed or are generally intetested
in the hex-beam? Please select
all that apply.

o Small footprint
o Light weight
o Low wind load
o Requires light duty rotator due to symetrical shape and light weight
o No tuning required
o Wanted beam antenna with gain on 40
o Wanted beam antenna with gain on 20
o Wanted beam antenna with gain on 17
o Wanted beam antenna with gain on 15
o Wanted beam antenna with gain on 12
o Wanted beam antenna with gain on 10
o Wanted beam antenna with gain on 6
o Didn't want to put up a tower
o Low visability
o No traps
o Broadbanded
o Low maintenance
o Cost per band
o Quality of construction
o Suitable for portable opertions
o Received as a gift
o Single feedline
o Reputation
o Referral
o Other - share as post if willing

To vote, please visit the following web page:

http://groups.yahoo.com/group/hex-beam/surveys?id=11141687

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups

From: David Douglass
Topic: 1531 Message: 1537

Pete,

I'd suggest you play about with some modelling software to look at the variations in antenna height. From memory someone has posted data for a 5-band Hex in the files section that can be used in MMANA Modelling software. This will give you an idea of the various takes off angles with different height.

Unless someone has a couple of Hex-Beams sitting a different heights, and can instantly switch between them, I doubt anyone could really answer your question. You also need to bear in mind that the 'ideal height' for one band may not be ideal for another!!

For what it's worth I wouldn't be shortening your tower, unless you have other reasons for wanting to lower the antenna!!

From: k4qcd
Topic: 1538 Message: 1538

Just worked VK3 land with my beam at 33 ft. with FT 920, no amp. and got a 58. The VK station was running 200w to a 4 over 4 Quad with hard line--a true commercial ant. and he was 59 to 10 over 59. Also, I couldn't build this ant. for the same cost, if I include the time it would take. Give the man the money--he earned it!!!

K4QCD--Bill DeLoach, Savannah, Ga.

1539. Explanation of No vote

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-05 14:03:02 UTC
From: Jason Hissong
Topic: 1539 Message: 1539

Hi guys,

Yea, that is me with the only no vote right now... :-)

Just wanted to explain my no vote in the latest poll. Trust me, I love my Hexbeam and it performs better than I expected. The only reason why I would not go for another is that I can get a quad that gets me gain on 12 and 17 for far less. That's all. However, the quads have a reputation for not withstanding the elements so I guess it is kinda grey for me. I can do quite a bit (like a whole K2!!) with the difference in cash between the quad and hexbeam.

Don't get me wrong, I think the Hexbeam is worth the money because of the workmanship (plus they are handmand) and the company is fantastic. A comparable antenna is the F12s 5 banders which are the same price but heavier.

I think that the poll helped me rethink my antenna plans. I would love to have an extensive antenna farm. The reality is that because of time and budget constraints I must make do with a small number of good performing, low maintenance antennas. I also live in an area of extremely high winds -- so low wind load factors are a prime consideration. My HX-5Bi fills that bill for me on the higher frequency HF bands.

Could I get higher performance with another antenna? Sure, but it would probably violate one of my constraints.

The next step for me will be to try to justify a tower to support a 40 meter antenna and some wires for the lower bands. Will I consider Hex-Beam? The same considerations that drew me to the HX-5Bi seem to be operable in this decision, too. Will I look around for alternatives? Sure, shopping for new gear is half the fun!

Well enough of my ramblings. As other commentators have suggested, the Hex-Beam is a compromise antenna, but one that fills the requirements of a bunch of hams.

I, too, live in an area of high winds...sometimes hurricanes but almost always a minimum of 10-15 mph sea "breeze". I am planning on a Hex beam or a Spider beam not only because of the low wind loading, BUT also because the cost of rebuilding it..... (when the wind loading wasnt low enough #8-) .....after a hurricane will be far less than other multi band beams.

HI Jim,

I'm thinking about getting the Spider Beam kit to play with although I think my HX-5B Hex-Beam still yields more bang for the buck ... smaller, good performance, and all five bands. 17 m will be a work horse band for the next few years.

Note that the SB is much larger than the HB and isn't as symmetrical as the HB. Wind loading introduces a bending moment in the support while the asymmetry introduces torque on the rotor and support. The latter is often the more important consideration.

Just a few thoughts.

73,
Barry - W4WB

Likely because 20 m is at the bottom of the poll Doug.

I wont be getting a kit, I will home brew it. And so far it looks like the Spider beam is easier to construct with two fewer arms and pretty straight forward. My main concern it replacing it later (i KNOW a hurricane is going to take it down so I might as well be prepared to replace it) so the simplest/cheapest is the way I will probably go even if at the sacrifice of efficiency.

1547. plate for homebrew hex

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-07 02:14:53 UTC
From: John Doe
Topic: 1547 Message: 1547

Does anyone know what thickness of aluminum plate (6061) is required for a homebrew 5 band hexbeam? I'm trying to find an approximately 18 inch square plate. I'm thinking 1/4 inch should be enough but 3/16 might save a little weight. But I really don't know the strength of aluminum...I'm an EE not a ME ;-)

I'm so cheap I would try the plywood route but I don't want to be working on it every year.

Any ideas? Thanks In Advance.

I live near Cabela's (Faribault, MN) and have one of their crappie rods. I use it for a telescoping mast with a half wave "roll up" 2 meter antenna (when hiking). But my guess is it would be too flimsy to last very long in a hex-beam configuration. Ed, N0OQ

I tried to use six of their 13' rods, but it didn't work out. I had two U-bolts per rod on my plate, and they crushed several of the rods where they made contact. My next step is to buy the fiberglass tubes that nest from MGS.

1554. Re: crappie rod for speaders?

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-09 14:23:33 UTC
From: ve7ask
Topic: 1548 Message: 1554

I used the first four sections of the 16.5-foot Cabelas crappie pole in a spider beam (same hub construction as my homebrew hex, but with four spreaders instead of six). The last section of the rod is very thin, so I took it out.

To prevent the U-bolts from crushing the fiberglass pole, I inserted short sections of fairly large diameter (I think it was 1") wooden broom handle into the stub ends of the poles. Worked like a charm.

Later, to make the poles longer (closer to the 16.5-foot original length) I added 3-foot sections of PVC pipe filled with dowelling to each spreader. That, too, has worked out well.

The crappie pole isn't the ideal solution and may need mechanical help for some uses, but it's a very inexpensive alternative for folks who want to test a concept before investing in more costly spreaders.

You need to put wooden plugs into the ends of the rods to prevent them
from crusshing.

1556. Installation tips

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-11 01:33:34 UTC
From: Marty N5NW
Topic: 1556 Message: 1556

I have acquired a used 5-band hexbeam and a 40 ft. aluminum tower. On the tower, I have a vertical dual-band base antenna for VHF/UHF. Can this antenna be mounted above the hexbeam? Or will the resulting pattern be unuseable? I'd really like to kick the VHF/UHF up to the 45-50 ft level. I don't think sidearms are an option at this point.

Thanks for the advice ...

Should work fine if you put an offset bracket for the vert. ant. and run it up the cold side of the HB between the reflector and driven element.

1559. Re: protecting crappie rod for speaders

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-11 02:19:26 UTC
From: w4wb
Topic: 1548 Message: 1559

I believe you will find that the rods will last better if you use Sch. 40 PVC over the rod end. The PVC ID should be just a bit smaller than the rod's OD. Next cut down the length of the PVC so that you have a split C. Now use a screwdriver or something to spread the PVC enough to get it over the rod. The resulting load from the U-bolts will be spread over the rod much better and greatly reduce the possibility of harming the rod.

This is a good idea to do to older Hex-Beam as well.

Hello Eric and others...

Like yourself, I operate mostly on 17 and 20 meters (with tuned wire loop) but would like to move up to a dual bander Hex Beam. I've even called the company to inquire about the possibility of a 17/20 dual bander. I was told that development costs preclude offering such an antenna, at least for now.

So, home brewing a two band version may be the only alternative but I got the impression when I talked to the company that you may be in for a challenge finding the right measurements, etc. Designing it with two feed points rather than a common feed point might simplify things.

Just my thoughts. Hopefully someone has already perfected a homebrew design will speak up here. If not, maybe you will share your experience as you undertake your project.

Best wishes,

Don

MGS offers fiberglass rods and tubing. They have a range of sizes
that "nest", so that erlatively long lengths can be made of from 8'
sections. Their web site is at http://www.mgs4u.com/fiberg.htm

Good Luck and 73

1563. started my Martha beam today...

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-11 23:28:46 UTC
From: John Doe
Topic: 1563 Message: 1563

Well I found bamboo at kmart with the Martha Steward name on it so I'm calling my beam the Martha Beam. I don't figure Martha's lawyers will get after me about it since they're pretty busy right now...HI HI

Anyway. I got the 20 meter driven element and reflector strung and I tried to tune it by feeding it to my Drakes. The best SWR I could get was 2.4 at 14.2 MHZ, and it goes up from there on both sides of that frequency. 14.2 MHZ looks like resonance.

I'm wondering if I have something wrong, or if the close proximity to ground is causing it. The base is only 3 feet off the ground, and it's going to take more coax to get it hgher, and I have the coax coming next week.

Have any of you noticed what your SWR was when you were tuning the wires lengths with it near the ground? Did it change when you got it to the recommended height of 40 feet?

Thanks for any help you can give me.

Joe

1564. Hex Beam 287 almost on the air

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-12 01:28:13 UTC
From: axelrodw
Topic: 1564 Message: 1564

First, Thanks to all who responded to my request for advice regarding the Hex Beam. I got it together today. Thanks to the info available on Hex Beam site and everyone's advise, I had enough info to supplement the tech manual.

The beam went together with no problems and I test drove it some tonight with it sitting on a card table about 3 feet off the ground out in the back yard. Much to my surprise, the SWR was within specs on all bands except the upper part of 10 meters. I aimed it vaguely north east and worked a couple of Europeans on 20. That's good enough for now.

Tomorrow comes the hardest part of the installation - digging the hole to mount the mast and rotator.

I'll share my impressions once I ge it up in the air.

73... Bill K3WA

Bill,

Let us know when you get it on the air... maybe we can get an impromptu
Hexbeam net together and work you!

What about mounting the vertical VHF/UHF to the main mast of the hexbeam, at the top?

Should work fine if you put an offset bracket for the vert. ant. and run it up the cold side of the HB between the reflector and driven element.

Thanks for the help ... it will be a while before I can get the tower up, so
I can think about things for a bit. I may leave the vertical on the current
chimney mount.

1569. Mounting the Hex Beam to the HDX-30 mast

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-12 12:25:52 UTC
From: Bill Axelrod
Topic: 1569 Message: 1569

All,

As I work towards putting my Hex Beam in the air...

The Hex Beam manual says I should drill a hole in the bottom of the hub plate and through the mast to put a locking bolt in place.

The adapter that comes with the HDX-30 mast looks like a pretty solid piece of metal.

For those of you who have used this combination - have you drilled the hole for the locking bolt? Any problems? Any hints?

I live in an area that is NOT subjected to much high winds or icing. The beam will be behind the house below roof level (antenna restrictions) so will be protected from North winds.

I appreciate any advice.

73... Bill K3WA

1570. Postscript on sleeve for protecting HB arms.

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-12 20:18:54 UTC
From: w4wb
Topic: 1570 Message: 1570

I have had several folks ask the question about why you shouldn't put a dowel into the Hex-Beam arm. The reason is that the Hex-Beam armsy are tapered and a constant dowel diameter may result in a fracture at the inter-most location of the dowel under heavy loading (wind, ice, etc.). The U-bolts also put stress directly onto the fiberglass of the arms, which is not good either.

Placing the slit PVC pipe (about 5-6" long) over the end of the arm allows the pipe to form a conical sleeve that matches the conical shape of the arms. When the U-bolt is tightened down over the PVC pipe, the stress is spread over a larger area of the arm and hence protects it from fracture.

The same is true for the fishing rods regarding distribution of the stress.

73,
Barry - W4WB

1571. Re: where to start?

Eric,

If you are eventually planning to have 5 bands I would suggest you go straight to making the 5 band version and forget about the 2 bander. Reasons for this are..

1. If you make a 2 bander first, you will have to modify the length and tip spacing on the elements, when you add the extra bands..

2. Dimensions are already available for the 5 band version, so this will save you a 'lot' (and I mean a lot) of experimentation..

3. I really don't think building a 2 bander would be much simpler than a 5 band version.

1572. Hex beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-13 13:39:32 UTC
From: srietkovic
Topic: 1572 Message: 1572

Hello all people in group !!!

I looking for detail descriptions and dimensions of this antenna.Before few year a have a 2 el CQ but his is damaged from very strong wind (180 km/h!!!) and now i reading about Hex Beam antenna ,and my conclusion is that is very good and not too big for my roof so people please help me making my own Hex Beam !!

Best regards from 9A5WW !!!!!!!!!

1573. martha beam nearly complete

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-14 02:27:39 UTC
From: John Doe
Topic: 1573 Message: 1573

well the Martha Beam is nearly finished. (I call it that because it is made with Martha Steward bamboo rods from Kmart.) I finished adding all the wires for all 5 bands and changed the center feed points to use coax down the mast. Also, the plywood base has been primed once, and painted twice with good house paint. I also painted the bamboo spreaders for a little more protection. I must have spent 5 or 7 hours playing with the wire symetry

Testing at 5 feet indicates SWR is getting down to about 1.6 on 10/15/20 meters but is very sensitive to antenna direction for some reason. That's probably because of the very close proxity to vegetation or my garage or my neighbor's house ...HI HI...I really need to get it into the air to tune it in, but it's looking very good at this point.

I need to gather all the things I need to get it up on a 36 feet radio shack mast. Hopefully sometime next weekend I'll get it on the air at 40 feet.

From: kg4eqd
Topic: 1547 Message: 1574

> I'm so cheap I would try the plywood route but I don't want to be working on
> it every year.

I'm so cheap, I DID use plywood, and it lasted longer than I would have guessed.

I had a homebrew tri-bander up for about two years(17m, 15m, and 10m). No 20 meters, the spreaders were too big, nor could I get it high enough for 20 meters. Great F/B ratio, good ears in front.

My 15/32 plywood(cut from scrapped interior CDX) base plate was just fine, until a 25 pound tree branch fell across it during our ice storm last December. Actually, the branch was much heavier, because it(and the antenna) were loaded down with ice.

The plywood had several coats of exterior paint before it went up in the air. It showed no signs of rot when it came down.

I have decided to use the two plywood ends off a spent rg-58 coax spool as replacements. Epoxied together, they should be good for several years. But I think I'll wait until the next sunspot peak....

Also, I had used PVC for the spreaders, guyed together with tarred nylon "trot line". None of those are broken, but the crappie rods are a better idea for reducing the weight.

I enjoyed building that antenna as much as using it. My XYL was, however, somewhat less enthusiastic....

Have fun with it.

Well I did end up using a plywood base and bamboo spreaders to make a 5 band beam. I coated the plywood with 2 coats of primer and 2 coats of good exterior house paint. I painted the bamboo spreaders twice. Who knows how long it will last but I'm giving it a shot. The antenna is complete but I need to put it up on a mast, hopefully this w/e. Total cost of antenna was about $50. If it breaks it can be rebuilt. I can't hardly wait to fire it up at height.

There are still DX opportunities out there. Yesterday and today I worked two SV stations on 20 m on first call. Also got a TA on 20 m today --- first call. Odd conditions on 20 m yesterday afternoon resulted in a nice 15 minute QSO with JA7DXX with us both 20/9! Other EU stations there also. The old Hex-Beam keeps on singing!

1578. martha beam is up at 20 feet and pointed north

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-19 00:21:31 UTC
From: John Doe
Topic: 1578 Message: 1578

rotor not functioning yet but I was able to get the push up pole to 20 feet. SWR on 20 is 1.18 at 14.2 mhz, swr on 15 is 1.0 on 21.2mhz, and SWR on 10 is 1.7 at 28.5 which is my lowest freq on my drakes. SWR looks unbelievably good.

Tomorrow morning I'll get the rotator going, and pull it up to 40 feet.

1579. Martha beam up and running

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-20 15:15:10 UTC
From: John Doe
Topic: 1579 Message: 1579

I finished the installation yesterday. After all my worry about SWR on 20 meters, I now have 1 watt coming back with 900 going forward for an SWR of 1.07. I'll take it. 15 also is flat. I have 10 cut a bit long so I'm getting 1.7 at 28.5mhz but it's falling nicely from the higher freqs.

Signal reports yesterday on 20 were very promising. QSB makes it a little difficult to get reliable readings but here is what I got. F/b look like about 5 dB. Off the side it it looks like 20 dB or more.

1583. New use for Hex Beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-21 03:58:22 UTC
From: Garry
Topic: 1583 Message: 1583

Well I found a new use for a hex beam. I have been paying for satellite tv for some time now but I do get a couple of local channels with rabbit ears. Today I made a small hexbeam for the vhf portion of the TV band and ran it up about 14 feet, fed it with rg59u. Man I can't believe it. I get 12 channels with that little antenna, some really great and the others all fully watchable. That's probably better than I been getting with the dish. (We don't hardly watch TV anyway except for local news during diner.) I kept cutting back on the service till I am right at the basics now and with the basic channels many are simple duplication of channels that run the same garbage but in a different time zone.

Guess I know where to tell the sat provider to put the dish LOL. I can get ten channels without even rotating the dish once I get it spotted to best advantage. And the Hex antenna is so small to boot.

Cheers

Garry Ve7ajj

Hi Joe,

Nice effort! If all you are getting for F/B is 5 dB, you need to
retune. Should see much more than that.

Hello hex-beam users!
I've just joined this list now.

I've been using HEX-BEAM HX-5Bi from Feb.,2003.
It works much better than I expected.
I'm very satisfied with it.
This antenna is small and light-weight
so that it's very good for installing JA's
small house :-)

Well done Joe, and hope your bamboo spreaders hold up OK.

Barry is right, and you should be getting a little better FB than 5dB. Acccording to the models they range from abour 9-12 between 12 and 20 metres, but it's pretty ordinary on 10 Metres at just above 6dB. Anyway, if it works OK, I wouldn't worry too much about the numbers.

Regards

David, VK2DPD

1587. Hexbeam compatibility with a nearby 6 meter beam

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-21 11:26:51 UTC
From: n1ix@att.net
Topic: 1587 Message: 1587

I have recently discovered the 6 meter band and I am thinking about putting a 3 element 6 meter beam on my tower just under my 5 band hexbeam. The distance seperating them would only be a few feet. I have read on this reflector and elsewhere that another antenna near the hex causes detuning of the hexbeam and SWR problems. Does anyone have any experience with another antenna near the hexbeam?

1588. Re: [hex-beam] Re: Martha beam up and running

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-21 11:32:27 UTC
From: John Doe
Topic: 1579 Message: 1588

I did a little more testing last night and f/b looks more like 10 dB. I've had reports ranging from 5 to 15 but fading was so bad yesterday it was pretty difficult to tell. The 5 dB f/b was the lowest anyone told me.

I was able to compare it with my inverted vee which is pretty much omnidirectional and I'm seeing about 8 to 10 dB of gain on the martha beam. I really could see the difference on very weak signals from europe on 20m (like S 2 or 3). Switching from the inverted Vee to the martha would cause the audio to jump out of my old Drake R-4c.

What I can't get over, especially with all of my trouble with SWR when it was on the ground, is the matching. I found a spot on 20 meters were I get 1 watt back with 1250 watts forward. Now that's a good match.

More testing to follow.

1591. Hexbeam on a side arm

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-07-23 02:06:53 UTC
From: Jason Hissong
Topic: 1591 Message: 1591

Hi guys,

I was thinking (oh no!) of mounting my Hexbeam on a side arm from Glen Martin. The side arm would be mounted to the mast. So the Hexbeam would still be close to the mast, but the mast would go through the hexbeam and allow me to put the 6 meter Hexbeam at the top. I think the only bad thing would be the weight over to one side. However, the hexbeam would be mounted right at the thrust bearing, right next to the mast so the weight to one side should not be much (on top of that, the 5 bander would not be that heavy.)

The other thing is mounting the side arm to the mast. Probably with some u bolts and some stainless steel plates drilled for the u bolts.

Any thoughts? Anyone else do anything similar?

I REALLY want to get the 6 Meter hexbeam installed on the tower. And putting it above the Hexbeam would be desirable...

73!

Jason

1592. Re: [hex-beam] Hexbeam on a side arm

From: IslPilot@aol.com
Topic: 1591 Message: 1592

Jason:

Why would you want the 6M hex on top? Shouldn't that go on the side arm because of the higher freq and reduced height requirement?

I have the 5 bander on my 65' tower and am considering putting the 40M Hex on top and moving the 5 bander to a side arm because the 40M Hex being lower in freq would benefit from being on top.

Curious if the rest of the group agrees with me

Paul,

Better to have it above than below, but it should be above as much as possible. 6 m likes height. My best antenna for 6 m was a 12-bay RCA antenna (300' tall) on top of a 1000' tower. Okay, during normal hours, we used it for Channel 2 TV. hi hi

It is important also that the side post be run up the cold side of the HB.

1594. Number 289 almost on the air

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-08-04 03:00:15 UTC
From: aa5charliehotel
Topic: 1594 Message: 1594

Hi there.

HX5BI Number 289 is assembled, mounted on the 40 foot pushup pole, is 12 feet up, and almost ready to go up the rest of the way. As soon as the guy ropes are cut and attached to the rings and a couple of pairs of extra hands can be rounded up, we'll see how well it plays. I haven't tried it yet as the coax still needs to be run through the attic and down the wall to the shack...not something I wanted to do this afternoon while it was 95 degrees.

When my wife (N5NAP) saw it assembled in the front yard, she said, "Is this about the last one?" However, this afternoon she said that that it was her "favorite antenna." She helped me set the pushup pole on the short pipe section this afternoon after I attached the rotor and the antenna.

I'm glad I reviewed the postings here before I put up the Hex Beam. As a result, I learned that guy rope should be used rahter than wire, what type and how many ferrite beads to use, and where to get them....very useful info. Thanks.

Hopefully, I will be able to post a report on how well it is working in a few days. My local ham friends think I'm nuts for purchasing this antenna, rather than a Cuschcraft MA5B or the TGM Hybrid Quad. After researching, I came to the conclusion that the Hex Beam was the best beam I could get in the air, using a heavy duty pushup pole and an inexpensive rotator. We'll see....

73,

Brad

Hi Brad.

Remind your friends that you are not nuts, just a new HexNut! With the Hex, you have gain and bandwidth on 5 bands where the MA5 and TGM do not. Let me know when you want a sched to run patterns or compare reports. Do you have another antenna as a reference?

Brad,

Awesome!! Glad you are making good progress. About your friends:

When that rare one comes up.... asked them how well they are doing trying to contact them. Then let them know that you got em on a first try!! HIHI... seriously though, as Doug, W6HB, mentioned, you get gain on 17 and 12. You cannot go wrong with that.

I work QRP alot and my Hexbeam really helps my little signal get out. I worked Greece on 100mW a couple of days ago. It was exciting!!

Anyways... I would also like to set up a sched with you... I will be in Keywest for 10 days leaving on Thursday. Maybe Doug, myself, and you can get together and then we can do some comparisons. I have a vertical, dipole, and the Hexbeam and that way we can test things out.

1598. martha beam update

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-08-07 22:09:50 UTC
From: John Doe
Topic: 1598 Message: 1598

Hi guys,

Martha has been performing beautifully for the last three weeks with one exception. I was tuning up on 20 meter and trying to squeeze a few more watts out of the drake l4b and all of a sudden I see the reflected power shoots way up. A visual of the antenna revealed that I melted the nylon rope holding the 20 meter driven element.

I drop the beam down, installed lexan insulators on all of the driven elements and pushed her back up to 40 feet.

She now takes 1350 watts with no more smoke. We had a few wind gusts with some local tstorms last week, and the beam doesn't seem to move much at all.

that is all

Joe

1600. Number 289 on the air...first impressions

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-08-08 00:15:16 UTC
From: aa5charliehotel
Topic: 1600 Message: 1600

This post is rather long, but it may be of some use to those who are considering a Hex Beam. I know that I browsed through these posts before purchasing one.

HX5Bi Number 289 is in, and on the air! It is mounted on a 40 foot pushup mast and is guyed with 5/16" dacron rope at 20,30, and 40 feet. It is being turned with a Channel Master 9521 Rotator. There are 8 Amidon Type 77 ferrite chokes over the coax just below the hub plate of the antenna. The coax run (Belden 8214 RG8U) is approximately 180 feet. The antenna is approximately 40 feet from the house. A 160 meter off center fed doublet (OCFD) at 45 feet and a large tree are both within within 20-30 feet of the Hex Beam. A GAP Voyager (160/80/40/20m) is approximately 60 feet away. The first test was SWR...

1.5:1 or less SWR bandwidths(as measured with the Kenwood 950SDX internal meter):

28.000 - 29.000 Mhz *
24.890 - 24.990 Mhz
21.000 - 21.450 Mhz
18.068 - 18.168 Mhz
14.000 - 14.350 Mhz

* The SWR peaks at approximately 2:1 at 29.4, but dips to less than 1.5:1 at 29.600.

The autotuner in the 950 was able to quickly "tune" the antenna to 30 meters.

One has to be careful when comparing a beam with a long wire antenna such as the OCF Doublet because the doublet will have significant gain in its favored directions, and will perform rather poorly in its nulls. In other words, the antenna I am comparing to the Hex Beam is not a standard half wave dipole, which is a widely accepted reference for gain and performance comparisons. The performance of the GAP Voyager on 20 meters is dismal, so it can not be assumed to be representative of other commercial verticals. All that being said...

I didn't get a chance to play with the HexBeam until 2:00 AM Local time the other night. There was a station in Hawaii around 14.245 with a fair signal. I tuned up the doublet with the manual tuner and switched between the Voyager, the OCF Doublet, and the Hex Beam. The received signal strengths were:

Voyager S2-S3
OCFD S4-S5

Hex Beam S7-S8

I then compared received signal strengths of several stateside and DX stations in various directions. The relationship remained fairly consistent with the Hex Beam beating the Voyager 5-6 S units, and the OCFD 2-4 S units.

A more important test (at least to me):

One of the reasons I upgraded to the Hex Beam was because a friend in CA was having trouble hearing me on 20 and 17 meters, as he apparently was in one of the OCFD's nulls. The Voyager is pretty useless on 20 meters, so I often had to use the amp. High power, an antenna tuner, and open wire feedline in the shack is a recipe for RFI. I got tired of not being heard and fighting the RFI.

Last night on 20 meters I was in QSO with the friend in CA and a local ham that lives on the other side of town. The local guy was running 250 watts into a Cushcraft A3 at 50 feet. I was running 150 watts into the Hex Beam at 40 feet. The friend in CA reported that our signal strengths were virtually identical. I consider that a success. The antenna showed moderate front-to-back rejection, but seemed a little weak on front-to-side rejection. I didn't write down numbers as forward gain is my primary interest at this point. I may do some more detailed comparisons later. When band conditions improve a bit, I can also try it on the other bands...right now 15, 12, and 10 are pretty dead here.

The cost issue...

When I first opened the box, I was a bit dumbstruck at how little I received for roughly $900. After I had assembled the antenna, I concluded that, unless Traffie is making an obscene profit on these, the majority of the cost must be in labor. I was impressed with the quality of the components and assumed that it takes some time to cut the wires to the correct lengths, fabricate and/or attach the connectors, prepare the center support, drill the hub, etc. Apparently, several of the components of the Hex Beam are not manufactured or available in quantity, and must be assembled by Traffie.

One of the selling points for the Hex Beam is its relative low cost when compared to standard yagi/rotator/tower installation. There were some unique needs in my particular installation that others probably wouldn't have (such as setting 8 foot landscape timbers in cement for the guy posts...done to get the ropes away from the dog and make the installation more acceptable to the wife). My coax and rotator cable run is probably longer than most. I hired a local television antenna installer to come help with the final phase of pushing up the mast after I realized how heavy that last section would be and how inexperienced my friends and I were...the best $40 I spent. It took both of us standing on tall step ladders to push up and secure the

mast sections. The option of mounting the rotator on the ground bears looking into if you are considering the Hex Beam. The bottom line...it cost me approximately $1500 to purchase, ship, and install the Hex Beam and the related equipment. That is significantly less than installing a small crank up tower and a typical 5-band yagi, LPDA, or Quad, and somewhat less (I believe) than installing a few sections of 25G, an appropriate rotator, and one of the above antennas. It certainly is easier.

Another(?) bottom line... I wanted the best antenna I could support with a push up mast and turn with an inexpensive rotator. I am just not in the mood to put up a tower where I am right now. I wanted some forward gain on 20-10 meters and wanted to eliminate the hassle of manually tuning the doublet whenever I change frequency, the strange nulls in the doublet, and the RFI inherent in having open wire feeders to a non-resonant antenna in the shack. So far, it appears that all my goals have been achieved with the Hex Beam.

The Hex Beam is a very expensive antenna. Frankly, I think $500-$600 is a more reasonable price range for what you receive, and would be more competitive with the other two element mini-beams on the market. However I don't regret my purchase a bit and believe that in the long run, the antenna will continue to prove its value to me. I had considered a Cushcrat R8 vertical...a friend (who ridiculed me for spending $900 on the Hex Beam) purchased and installed an R8 for approximately $500. The SWR is not below 2:1 on any band and he cannot get any response from Cushcraft. I had a pleasant conversation with Mike Traffie when I placed my order and he gave me some tips on installation. I have no doubt that if I had trouble, he would do whatever he could to help me get it fixed, and there is the return policy...those "intangibles" are worth a lot to me.

Hope all this bandwidth was of some use....

73,

Brad Johnson
AA5CH

1601. 6 meters with a HF 5-band hexbeam

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-08-11 05:14:08 UTC
From: ab0si
Topic: 1601 Message: 1601

After seeing some comments here about the 5Bi loading on 6 meters, I decided to give it a go. I started playing on 6 meters in mid-June and after a 3 week vacation in July I tried it again this weekend. I have no idea what, if anything, it proves, but I've managed to work 33 states and 79 grids from Minnesota (FN34) using 100 watts with the hex at 45 feet.

As far as I can tell, the hexbeam is almost completely unidirectional on 6 meters.

Any comments on installing a "real" 6-meter directional antenna about 8 feet under teh hexbeam?

Paul

1602. Re: [hex-beam] 6 meters with a HF 5-band hexbeam

"As far as I can tell, the hexbeam is almost completely unidirectional on 6 meters".

Given that it probably exhibits gain of 0dbi or less on 6mtrs, yours being unidirectional must be something of a nuisance and I wonder if that is really what is happening. Mine for example is omnidirectional on 6m.

Eric.

Subject: [hex-beam] 6 meters with a HF 5-band hexbeam

After seeing some comments here about the 5Bi loading on 6 meters, I decided to give it a go. I started playing on 6 meters in mid-June and after a 3 week vacation in July I tried it again this weekend. I have no idea what, if anything, it proves, but I've managed to work 33 states and 79 grids from Minnesota (FN34) using 100 watts with the hex at 45 feet.

As far as I can tell, the hexbeam is almost completely unidirectional on 6 meters.

Any comments on installing a "real" 6-meter directional antenna about 8 feet under teh hexbeam?

Paul

I found that my 5bi loads on 6 meters but my 40 meter full wave loop works much better. I have worked a few Europeans (easy from the east coast) and a few states in the past week or so. I would also be interested in any comments about installing a "read" 6 meter beam under the hex.

1605. 17 meter hex beam plans

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-08-12 21:09:09 UTC
From: glockingham
Topic: 1605 Message: 1605

Hi all,

I like what I've been reading about hex beams and believe I have enough fiberglas rod and wire to build one. Of course I have to fabricate the mount. I was wondering if anyone had plans for a 17 meter version. Please email to me at kb9e@...

Thanks and 73'

Ron

From: Koos van Wyk
Topic: 1498 Message: 1606

Hi all HB users
I received your emails regarding the Hex Beam here in South Africa for the past 4 - 5 months and found in very interresting. The HB is not available as a buy here and I am considering building one. Please let me know where to get the plans with technical detail (or is that not "legal" ?) If I can only build a 10. 15 and 29 Mtrband model to start with. Fibre rods and the Hub is not a problem.

Hi Pete,

Traffie tunes them at about 43.5'. Take a look at the model and you will see that the elevation lobe splits. I have my HB (20 m elements) at about 38' and works fine (single lobe). When I had it at 56' for FD last year, I could easily detect the lobe spliting. Is it a real problem? Not really perhaps, but I suggest that you will find it to be better for most work to be at the 43' level. BTW, the model indicates that the third lobe (at 56') points up and a part of it even backwards a bit. Well, I made some NVIS contacts too in AL, MS, and TN (I'm located in north Alabama). ;-)
Remember that there is energy transmitted in each lobe, and energy received in each ... QRN/M potential.

From: dmwatkins20032002
Topic: 1607 Message: 1607

i find this antenna design to be a great one for my location have been building antennas since i have been a ham about 5 yrs. would like to build a dual band for ten meters and 6 mtrs. can anyone please e-mail me a set of plans or at least the formula for finding the lengths of the elements and or the spreaders. if this works out i will be happy to share with the group the results.

thanks one and all
73's mike kg4fsx

1608. Hexbeam VS Force12 C3

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-08-19 18:42:28 UTC
From: ZS1DX
Topic: 1608 Message: 1608

Hi Everyone,

I was fortunate to use a Hex-Pac beam on 20m and 15m this past weekend during the worldwide Lighthouse "party". I was very impressed with the extremely high construction quality. Unfortunately, the antenna was only elevated about 5 meters. A nearby radar installation caused a lot of QRM, while a huge beacon antenna was about 30 meters away. We still made contacts worldwide, and the Hexbeam certainly has potential, when installed at 12 meters.

I used DL7IO's models, and compared it to a C3 model from W4RNL. I was pleasantly surprised by the results, and posted them in the File section. (Hexbeam VS Force12 C3.pdf)

I'm no modeling pro HI, but am encouraged by the results.

Now, I only need to win the Lotto...

From: Greg Fischer
Topic: 1609 Message: 1610

Hi Ken. I saw one listed not too long ago I think. But you have to act fast on them. If I see another I will let you know. I have one here. Not as high as it should be, right now only at 30ft. But I am limited here. I am going to put a longer mast on it to get it at 35 which should help on 20m some.

It's not a great antenna as it's obviously a compromise system. But I do like that it has gain on all the bands it covers. I even tuned it up on 30 and 40m a few times and made some contacts with it.

K2 is coming along. Finished with the FP and control board and started the RF board. After a minor trouble shooting issue, all the first checks are fine.

Did you ever get to evaluate that tuning knob we talked about?

On the SteppIR, the elements don't move back and forth. I know that spacing is important on a Yagi. So with the spacing not moving along with the elements, aren't you compromising with that antenna? Seems to me that spacing is what gives you your F/B ratio vs Gain. If my memory serves me correctly, closer elements give you more gain but less F/B. Whereas longer spacing gives you more F/B. (All withing a certain wavelength of course.) So the SteppIR must be great on 20M for gain but not as well as F/B where the higher bands are the opposite.

This is just me thinking out loud... I have to verify my statements..

See ya!

Never having used one, I'm not in a position to proffer a view but see the FAQ section at www.steppir.com for their defense of fixed element spacing in the Steppir antennas. Generally though, nearly every average ham's hf antenna is a compromise in some fashion. I expect SteppIR users are universally delighted with performance just as all of us are delighted with the performance of our Hexbeams.

Very true! As you mention, they are all compromises and one antenna is probably not the best in all situations. For me, having the SteppIR would be an awesome thing... however, I do not have the tower or rotor for it. So the Hexbeam fit my needs very well.

Lately, I am finding that the difference in signal to be pretty darn good. I only have my S meter to use, but I am finding a jump between S6 to S9 from the dipole to the Hexbeam (broadside to the dipole). And side to side is even better. Front to back is about what the models say.

Still glad I went with my Hexbeam. I am sure that a Quad would do just as well (but bigger).

See ya!

From: Don Snodgrass
Topic: 1615 Message: 1615

Hello all...

I realize that this newsgroup is for HexBeam enthusiasts. However, since some members of the group like to home brew, I thought that I'd invite those interested to visit http://campus.murraystate.edu/org/msuarc/moxon/index.htm which showcases the ongoing efforts of a group of hams who are experimenting with home brewing 17 meter MOXON antennas. The next phase of our project will be to add 20 meters to the antenna with a common feed point. A 40 meter version is also in the works.

Best wishes,

Don

Topic: 1617 Message: 1617

I just completed my Hex Beam and have only the 20 mtr elements installed. I was anxious to see how it worked before I put all the elements on. One thing I have noticed is that there is a lot more background noise with the hex than with my inverted V. The hex is only at 15 feet, with the inverted V apex at 35 feet. This could be the reason for the difference. Just wondering if any one else noticed this characteristic?

It may be due to the fact that you are suppose to install all of the
elements (assuming you have a HX-5B) before you use it. This is due
to the fact that the elements interact with each other an influence
the impedance. Have you checked the antenna impedance with an
analyzer? Best bet is to spend the next 30 mnutes and put on the
other elements!

Have fun!

Russ, This is Bill, K4QCD, in Savannah, Ga.

My 5 band beam is on a homemade 33 ft. push mast. The rotator (Yaesu G-450A) is on a ground mounted, treated wood pad and the mast is supported by the house eave with a bearing and one level of Dacron rope guide wires. All but the electrical elements have been painted dark green and black making the system very hard to see against the tree line behind it. I stand on the roof and push the ant. up, with the help of a friend. The system has been flawless since installed in the fall of last year.

Performance has exceeded my expectations.

Good luck and good dx,

73 Bill K4QCD

I noticed more noise on my antenna as well... however, I found that it was from the power poles behind my house and the Hexbeam was picking it up better!! (because of gain that I have never had before.) In fact, when I rotate the Hexbeam due north (where the lines are) I get the RFI. My inverted V is perpendicular to the power lines so it was quieter. When the Hexbeam is pointing east or west, the noise is lowered (but not completely gone away).

I would put the other elements on and see what happens.

BTW... I just worked a new country with my HB... JT1CO. I just love my Hexbeam!!

Let us know if any changes occur when you put the other elements on...

The antenna does resonate on 20 Mtrs with a reasonable SWR (2:1). I did check the impedance with an anaylzer and found that the impedance is on the low side, closer to 30 ohms. I guess the noise might just be the location with the power lines in the back yard at the same height the antenna.

I started to added the other elements, but one of the the spreaders I'm using (a Cabella Crappie fishing pole)cracked as I was tightening a hose clamp to hold the 10 mtr element. I stuffed dowels in it for a temporary fix and I am going to order fiberglass rod with a thicker wall.

Thanks.....Harvey - WA2AAE

The antenna does resonate on 20 Mtrs with a reasonable SWR (2:1). I did check the impedance with an anaylzer and found that the impedance is on the low side, closer to 30 ohms. I guess the noise might just be the location with the power lines in the back yard at the same height the antenna.

I started to added the other elements, but one of the the spreaders I'm using (a Cabella Crappie fishing pole)cracked as I was tightening a hose clamp to hold the 10 mtr element. I stuffed dowels in it for a temporary fix and I am going to order fiberglass rod with a thicker wall.

Thanks.....Harvey - WA2AAE

I haven't done this, but will be trying it when I begin building a "spider beam" later this year. But I think a good way to avoid the cracked poles is to make sure the interior is filled completely with a TAPERED insert, not a round insert that wont support all the wall. What I intend to try is stuffing a paper tower about 8" down the interior of the pole then pouring in enough epoxy filler (auto body stuff) to fill the butt of the pole. When that hardens it should give a perfect support for the walls of the pole.

Hi,
I came across a listing on Burghardt Amateur website listing the following:
HEXBEAM(HEXPACK) QRP 6,10,12,17,20 METER PORTABLE 449.95

The site is www.burghardt-amateur.com and go to the used section. I do not work for Burghardt-Amateur, but just a satisfied customer. In fact I bought my hexbeam from them. Act fast,it may go fast.

I've order fiberglass rod (1/2 inch) to resolve the
problem. The fishing rod walls were about 1/32 inch
thick and obviously not strong enough. I tried to save
some money not being sure if the beam would work, but
in retrospect should have spent a few more bucks
initially and bought the fiberglass material. It did
not cost that much more.

hello all,
my brother is going to put up a CobWebb antenna. never heard of it, but on first view it has some nice design characteristics, which may make it a less expensive alternative to the hexbeam.
http://www.g3tpw.ukgateway.net/
by the way, the hexbeam is up and alive. last week I worked #280 (V6, Micronesia).

The CobWebb is a multiband, dipole antenna made in the UK. I recall it supports 20m-10m with each dipole bent into a rectangle. This is an omni-directional antenna, not a beam. I've worked several hams in the UK using the CobWebb and all liked the antenna and said they performed as dipoles.

1630. Re: [hex-beam] CobWebb

Yahoo group: hex-beam (2001 — 2006)
Date: 2003-09-02 23:35:32 UTC
From: richy
Topic: 1628 Message: 1630

The cobweb is dipoles from 20 mtr - 10 mtr on an X frame, it is horizontally
polarised. I have been using one at about 27 feet for 2 years and am happy with it,
It is 8 feet square and looks very small in the air. 20 mtr performance is far superior
to my R5 vertical but as you go up in frequency the recieve signals seem to drop, I
can still hear more on the cobweb than the R5 on all bands 20-10 but the signal meter
readings are less, on 10 meters I rarely get any signal readings at all but still hear
everything the R5 can hear, I am not sure if this is because of the horizontal polarisation
of the cobweb

I was hoping to make a hexbeam sometime this summer but never seem to find
the time :-(

When I do get around to the hexbeam project I will post some comparisons between the
cobweb and the Hex, I am of course expecting the Hex to outperform the cobweb due to
it's directional nature.

I plan to have the Hexbeam about 3 metres above the cobweb so I am hoping the cobweb
will not detune the Hexbeam.

Have Fun

Hello! I am new to the group and I know nothing about this stuff. My Dad bought a Hexbeam HX5B-024 antenna in 2000 and he has since passed away. I have had some inquiries from locals about the buying the antenna. I was asked if this antenna is capable of wireless internet on the 2.4Ghz frequency - does anyone know the answer to this?

I would greatly appreciate any input.

Thanks!
Merri-Ann

hi all, while i dont have a hex beam and havent used a beam in a number of years, you should never have a beam antenna mounted at the same height of any power lines. whatis happening is, most of your radiated power is being absorb ed in the wires and they are changing the direction of your signal. just look in any antenna book about this. if at all possible mount the beam below the power lines or above them while youmstill may hear some noise tho, at least you will not be wasting all your precipus power in those wires, i just thought that you just might like to know. 73 all dirk ka2zbt

Hi Merri-Ann,

Sorry to hear about your dad. About the Hexbeam, it is not designed to provide the ability to use it on 2.4Ghz. It would be far easier (and cheaper) to build one. I think the impedence mismatch would cause a lot of signal loss. Others may want to comment on it.

While you can hook up a wireless Internet router to the Hexbeam, it would not be a very good performer. You may even be able to get your 2.4 Ghz signal out farther only by virtue of it being higher.

Anyways, good luck.

The antenna is for 10, 12, 15, 17, and 20 meters (HF spectrum) and not for 2.4 GHz. I expect that you are planning on selling it, so ask about $400-$500 if in good condition and is up in the air. If it is still boxed, ask $600.

Regards,
Barry - W4WB

Goodafternoon Gary, sorry to mislead you but all that is homemade is the push up mast!!! The Hex Beam--5 bander is "Store Bought". If I were to try to build one I think I would start with a monobander first and develop a construction method. Good luck and keep us posted!

Hex-beam builders,

I would like to mount the rotor as close to the ground as possible. Somewhere I saw a picture of a mounting with the guide wires just below the beam and the rotor mounted at the base. Can one purchase special guide bearings that will allow the mast to turn from below. I would appreciate any help on my problem. Thanks.

The spreaders I used are 10 feet long, made up of sections of fiberglass that telescope together. Max-Gax Systems sells the material I used. The 20 mtr elements are about 1 inch in from the end of the spreaders, and the other elements are adjusted to fit with the hex frame.
